

Tension Control Systems for Light, Medium, and Heavy-Duty Tensioning

Warner Electric

Founded in 1927, Warner Electric has grown to become a global leader in the development of innovative electromagnetic clutch & brake solutions. Warner Electric engineers utilize the latest materials and manufacturing technologies to design long life, easy-to-use clutches and brakes that provide improved accuracy and repeatability. Warner Electric offers the broadest selection of industrial clutches, brakes, controls and web tension systems available from a single manufacturer.

Reliable Warner Electric components are used in a wide range of markets including material handling, packaging machinery, food & beverage, elevator & escalator, turf & garden, agriculture, off-highway, forklift, crane and motion control. Applications include conveyors, lift trucks, wrapping machines, servo motors, capping equipment, combines, balers, baggage handling systems, military vehicles, hoists and lawn mowers.

Altra Industrial Motion

Altra is a leading global designer and manufacturer of quality power transmission and motion control products utilized on a wide variety of industrial drivetrain applications. Altra clutches and brakes, couplings, gearing and PT component product lines are marketed under the industries most well known manufacturing brands. Each brand is committed to the guiding principles of operational excellence, continuous improvement and customer satisfaction. Highly-engineered Altra solutions are sold in over 70 countries and utilized in a variety of major industrial markets, including food processing, material handling, packaging machinery, mining, energy, automotive, primary metals, turf and garden and many others.

Altra's leading brands include **Ameridrives**, **Bauer** Gear Motor, **Bibby** Turboflex, **Boston** Gear, **Delroyd** Worm Gear, **Formsprag** Clutch, **Guardian** Couplings, **Huco**, **Industrial** Clutch, **Inertia** Dynamics, **Kilian**, **Lamiflex** Couplings, **Marland** Clutch, **Matrix**, **Nuttall** Gear, **Stieber**, **Stromag**, **Svendborg** Brakes, **TB Wood's**, **Twiflex**, **Warner** Electric, **Warner** Linear and **Wichita** Clutch.

Warner Electric Tension Control Systems

Warner Electric offers the most complete line of tensioning products available. Several different types of electric and pneumatic brakes designed specifically for tension applications range in torque ratings from 1 oz.in. through 1785 lb.ft. Controls vary from simple manual adjust models through sophisticated closed loop dancer systems.

Whether tensioning wire, film, foil, paper, kraft stock, or steel, Warner Electric offers the right tension system for your application. Let our tension specialists help you design the ideal system for your needs.

About This Catalog

This Warner Electric Master Tension Systems Catalog provides the designer with a complete design guide. Matching system component performance characteristics to your application is made easier through the extensive "Design Considerations & Selection" section and product comparison charts. In addition to selection information, the catalog includes product specifications, dimensions, a glossary of terms, and an application data form. It is the most complete tensioning catalog and design guide available.

Warner capabilities:

- Control technologies from manual operation to closed loop dancer control
- Multiple technologies – Electric, pneumatic and electronic
- Full roll to core control
- Consistent tension, even during flying splices and emergency stops
- Web flutter eliminated to allow better registration control
- Reduction of material waste, downtime and maintenance
- Material flexibility – Thin films, heavy mylar, rolled metals, newsprint, paperboard, laminate foils, wire
- Global distribution
- Local, professional service.

Modular Control Units

BXCTRL **Web Tension Control**

The BXCTRL Web Tension Control is a solid state electronic control that receives a signal from dancer input sensors or two load cells (customer supplied). It integrates two separate Digital PID Controllers and two separate Open Loop controls.

- All set-up is done via SD card or computer
- When wired to dancer feedback, provides closed loop control with linear or auto compensation
- Easily integrated with BX2DRV driver for electric brake control

Modular Control Drivers

BX2DRV **Modular Control Driver**

Double channel driver provides output for 24 volt electric brakes when combined with BXCTRL

MCS 2000 DRV2 **Modular Control Driver**

Dual channel/ dual voltage driver provides output for 24 volt brakes with 48 volt E-stop braking requirements.

Analog Controls

TCS Series Analog/Manual Controls

The TCS-200 is a manual analog control for the Electro Disc Tensioning Brake. The control is a constant-current output type that uses a front panel or remote potentiometer to adjust the output. The TCS-200-1/-1H is a manual analog control for any 24 VDC tension brake. It can also accept a 0-10 VDC or 4-20mA analog input for adjusting the output. See page 46.

TCS-200

- Input: 24–30 VAC, 50/60 Hz
- Output: 0-270 mA continuous per magnet up to 12 electro disc magnets, adjustable 3.24 amps
- Torque adjust, brake on, run, brake off switch on front panel
- Remote torque adjust, roll follower inputs

TCS-200-1 Selectable Voltage

- Input: 115/230 VAC, 50/60 Hz
- Output: 0-24 VDC adjustable, 4.25 amps continuous
- Torque adjust, brake on/off, run switch
- Remote torque adjust, roll follower inputs

TCS-200-1H

- Input: 115/230 VAC, 50/60 Hz
- Output: 0-24 VDC adjustable, 5.8 amps continuous
- Torque adjust, brake on/off, run switch
- Remote torque adjust, roll follower, analog voltage or current option

TCS-220 Analog Tension Control

The TCS-220 operates an Electro Disc or other electromagnetic tension brake from an analog input (customer supplied) or the manual setting of the “Torque Adjust” dial on the control face. See page 48.

- Input: 48 VDC. 1.6 amps continuous, 6 amps intermittent. Analog inputs from roll follower or current loop.
- Output per magnet is 0–270 mA running, 270–500 mA stopping
- Cabinet mounting enclosure with exposed wiring or wall/shelf mounting enclosure with conduit entrance.

MCS-204 **Analog Tension Control**

The MCS-204 is a solid-state control designed for manual or analog input to operate one or two 24 VDC tension brakes. It is designed for use with the MCS-166 power supply. See page 47.

- Input 24–28 VDC @ 3 amps
- Operates from torque adjust control knob on front, remote potentiometer, roll follower, or current loop
- Panel mount with exposed wiring or wall/shelf mount enclosure with conduit entrance.

Dancer Controls

MCS-203 Dancer Control

The MCS-203 automatically controls web tension through a dancer roll and sensor. It has 24 VDC output for use with TB, ATTB & ATTC, and Magnetic Particle clutches and brakes. See page 49.

- Operates two 24 VDC tension brakes in parallel when using dual MCS-166 power supplies
- Full P-I-D loop adjustment and system gain adjustment for optimum control.
- Available in panel mount or enclosed wall/shelf mount enclosure.

TCS-210 Dancer Control

The TCS-210 automatically controls web tension through a dancer roll and position sensor. It outputs to an Electro Disc or other electro-magnetic tension brake. See page 50.

- Input: 48 VDC, 1.6 amps continuous, 6 amps intermittent
- Output per magnet: 0–270 mA running, 270–500 mA stopping
- Cabinet mounting enclosure with exposed wiring or wall/shelf mounting enclosure with conduit entrance.

MCS-207 Pneumatic Dancer Control

This control provides automatic web tensioning using a dancer roll and pivot point sensor. See page 51.

- Operates most pneumatic clutches and brakes
- Automatic control for precise tensioning with minimal operator involvement
- Full P-I-D loop and system gain adjustments for optimum control
- Switch selectable output operates E to P transducers (0–10VDC) or I to P transducers (1–5mA, 4–20mA, 20–50mA) with zero and span adjustments.

TCS-310 Dancer Splicer Control

The TCS-310 is an automatic splicer control that operates two Electro Disc or other electromagnetic tension brakes, one brake controlling and one brake holding, or two tension brakes operating simultaneously. It can also be used as a dual brake control operating up to 24 MTB brake magnets. See page 52.

- Input: 48 VDC, 3.2 amps continuous, 12 amps intermittent
- Output per magnet is 0–270 mA running, 270–500 mA stopping, 0–90 mA holding
- Available with NEMA 4 enclosure

Power Supplies

MCS-166 Power Supply Module

The MCS-166 Power Supply Module provides power for the MCS-203, MCS-204, MCS-207 control modules. See page 53.

- 120V/220V/240 VAC, 50/60 Hz
- 24 VDC, 1.5 amp output
- May be connected in parallel for increased current capacity.

TCS-167 Power Supply

The TCS-167 Power Supply provides power for either the TCS-210 or TCS-220 control modules. See page 53.

- 120V/240 VAC, 50/60 Hz operation, switch selectable
- Output: 9 VDC @ 1.5 amps and 48 VDC @ 1.6 amps continuous, 6 amps intermittent
- Internally fused for protection.
- Available in enclosed wall/shelf mount enclosure.

TCS-168 Power Supply

The TCS-168 Power Supply provides power to either the TCS-310 dancer tension controls. See page 53.

- Input switch selectable for 120 or 240 VAC, 50/60Hz
- Output 3.2 amps continuous, 12 amps intermittent

Electric Brakes & Clutches

TB Series Basic Tension

Annular style 24 VDC tension brakes for light to medium duty unwind tension applications.

- Sizes: 1.7" to 15.25" diameter
- Torque range: 0.50 lb.ft. to 256 lb.ft.
- Thermal range: .019 HP to 1.09 HP

ATT Series Advanced Technology

Designed for intermediate web tension ranges. Three size ranges.

- One piece clutch design for easy shaft mounting
- Brakes are flange mounted and the armature is the only rotating member
- Clutch torque ranges 7 to 41 lb.ft. Brake torque ranges from 8 to 62 lb.ft.
- Replaceable friction faces and armature rings.

MTB Series Modular Tension

Modular Tension Brakes (Electro-Disc) are modular caliper type electric brakes used for unwind tensioning. Torque is varied by disc diameter and by changing the number of magnets on the friction disc(s).

- 10", 13", 15" and 20" diameters
- Torque ranges to 750 lb.ft.
- Thermal capacities to 6 HP
- Brakes rebuildable by changing only friction pads and armature disks.

M Series Permanent Magnet

Permanent magnet brakes and clutches are ideal for light tensioning applications, such as film and fine wires. They require no external power, have a wide range of torque adjustment, have no friction surfaces to wear, and offer chatter-free torque control even at very low speeds.

- Torque range from 1 oz.in. through 65 lb.in.
- Manual torque adjustment
- Constant torque with varying speeds.

Magnetic Particle

Self-contained magnetic particle clutches and brakes for a wide range of unwind/rewind applications offer smooth operation at very low speed and electronic control compatibility.

- Torque range from 2 lb.in. through 578 lb.ft.
- Shaft or flange mounting
- Fan cooled in largest sizes.

Pneumatic Brakes & Clutches

Mistral

Mistral Pneumatic Tension Brakes' compact design meets the special needs of the corrugating industry.

- Fan cooled for longer life
- Three sizes for multiple applications
- Torque range: 1 lb.ft. to 442.5 lb.ft.
- Thermal capacity to 3.5 HP
- Three sizes from 9" to 16" diameter. Eases handling small roll ends.

ModEvo

Modular Pneumatic Tension Brake allows for a wide range of tension applications with the modular design. Actuator configuration with different friction material coefficients allow for much greater range capabilities.

- Torque range from 16 lb.ft. to 3180 lb.ft.
- Optional guards and cooling fan assemblies
- Thermal capacities to 18 HP
- Optional high speed armatures

Sensing Devices

Ultrasonic Sensors

- Analog outputs with selectable 0–10V – 4–20mA
- Input voltage 20–30VDC
- Range control zero and span
- Short circuit protected
- 80" max. distance
- Response time 50 mSec

Pivot Point Sensors

The TCS-605-1 and TCS-605-5 pivot point sensors close the feed back loop to the tension control by sensing dancer roll position.

- TCS-605-1 is a single turn potentiometer with a resistance of 1K Ω for normal dancer operating ranges within 60° of arm rotation.
- TCS-605-2 is a single-turn potentiometer with a resistance of 5K Ω for normal dancer operating within a 60° range used with AC & DC drives.
- TCS-605-5 is a five-turn potentiometer with a resistance of 1K Ω for festooned dancer systems, with a 300° rotational range.
- BTCS 620 is a European style pivot point sensor. Includes switch for signal inversion.

Tension Control Systems

Application Examples

Dancer Control

The dancer control system consists of a power supply, dancer control, pivot point sensor, and controlling element, i.e., tension brake or clutch. Dancers provide the web tension while the control and controlling element stabilize dancer operation for unwind, intermediate zone or rewind tensioning.

Analog Control

The analog system consists of a control module, power supply, and a controlling element, i.e., tension brake or clutch. The analog controller provides output proportional to the input signal for use in unwind, intermediate zone or rewind tensioning.

Electronic Control

Electronic control systems are very similar to analog control systems with the exception of using an electronic sensing element such as an ultrasonic or photoelectric sensor. The sensor monitors diameter change in either the unwind or rewind rolls, and provides a corresponding change in output.

Dual Brake Unwind

Dual brake unwind incorporates modular tension brakes and an analog control system. The brakes retard the unwind roll, creating tension in the web. An external, customer-provided signal adjusts the output current to the brakes to maintain the proper tension. The dual channel controller controls each brake independently or simultaneously.

Single Roll Magnetic Particle Brake Unwind

The magnetic particle brake retards the unwind roll, maintaining tension provided by the dancer roll's weight. The pivot point sensor signals the controller to vary the current to the brake.

Tension Control Systems

System Configurations

Technical Considerations – Tension Zones

I. A tension zone in a web processing machine is defined as that area between which the web is captured, or isolated. Virtually any machine can be broken down into tension zones, and it is important to do so to properly address maintaining the tension required.

Simple machines, such as rewinders or inspection machines, may have only one zone (see Fig. 1). The primary goal here is to control tension so that the rewound package is accurately wound. Typically, the winder (A) would be a simple line speed motor drive, with tension controlled by a brake system at the unwind (D). The method of brake control (i.e.: open or closed loop) would be determined by the accuracy demands of the application. For simple diameter compensation, an ultrasonic sensor measuring the diameter of the roll can produce satisfactory results. Greater accuracy may require closed loop feedback, such as from a dancer or load cell.

Figure 1 - **Single Zone**

Figure 2 - **Two Zones**
(winder and unwind)

Figure 3 - **Multiple Zones**
(winder, intermediate, unwind)

II. More commonly, a machine will have driven nip rolls in the center, or processing section (see Fig. 2). A simple slitter/rewinder is an example. In this case, there are two separate tension zones to deal with and the tension levels may be different in each zone. Different tension levels are possible because the web is captured at the driven nip rolls, thus creating separate and distinct unwind and rewind zones. The driven nip rolls (B) will typically be powered by a motor drive that establishes machine line speed. Processing tension will be controlled by a brake system at the unwind (D), and a clutch or motor drive will control the winder tension (A). Again, the method of control will be dictated by the accuracy of tension control required in each zone. If process tension levels can vary by 10% or greater, a simple open loop brake control system may suffice. More accurate control would require a closed loop system, such as dancer or load cell feedback. Likewise, in the winder zone, open loop control may be sufficiently accurate, or closed loop or taper tension control may be required.

III. More complex machines will usually have multiple intermediate zones in addition to the unwind and rewind zones (see Fig. 3). One of the intermediate zone drives will typically establish line speed, and the control of drive rolls for the other zones will relate to this drive. In some instances, a simple master/follower relationship with a speed differential ratio will provide the draw tension necessary in that zone (i.e. Fig. 3 – B & C). In other cases, this may be accomplished with

closed loop (dancer or load cell) trim. The rewind (A) and unwind (D) would be handled as described in II. Multiple intermediate zones can become very complex, particularly if high degrees of accuracy are required. As a general rule of thumb, control of any zone should be accomplished at one end of the zone only. Control systems at both ends of the zone (for that zone) will generally result in instability of tension levels.

Reliable and accurate control for all system design layouts

Open loop tension control systems provide the least expensive manner to provide a degree of web tension control with the minimal amount of components. Open loop tension control can apply to unwind, intermediate, or rewind tension applications.

Although not as sophisticated as most closed loop tension control systems, a degree of controllability is achieved. Using open loop tension systems, one does sacrifice such things as web storage for acceleration, deceleration, and E-stop conditions. Tension variations during machine start or stop are common with this type of system.

The most common of the various tension systems are generally comprised of the controlled device; i.e., brake, clutch, etc., a simple controller or power supply, and a controlling element, i.e., a potentiometer or some type of analog sensor.

Because of system simplicity, tension is maintained for diameter compensation only in an unwind or rewind system, and no compensation is provided for acceleration, deceleration, E-stop or out of round roll conditions.

Open Loop System

Tension variations of 25% or more may be possible during acceleration or deceleration, and 10% or more during running due to out of round rolls or variations in the process machines.

These types of systems lend themselves nicely to applications where tension variations are not a concern, and

hold back on a rewind role or scrap wind up is needed. Operator adjustments are usually required when material tensions or roll diameters are changed initially.

Typical Components

For the simplest of unwind systems, the following components might be used:

- Tension brake coupled to the unwind roll, i.e., ATTB, TB, magnetic particle, or MTB, or pneumatic brake
- Tension controller to provide control current or voltage to the brake, i.e., TCS-200-1, MCS-166/MCS-204, TCS-167/TCS-220, MCS-166
- Control, either the manually adjusted type with a control potentiometer, or through an external potentiometer coupled to a follower arm, or ultra-sonic or analog proximity sensor monitoring roll diameter.

Flying Splicer

Specially designed solid state splicer control holds the unused roll stationary while tensioning the operating roll. Dancer variation sensing and subsequent adjustment are virtually instantaneous for accurate tensioning during the splice, typically at less than 1% variation.

Tension Control Systems

System Configurations

Closed Loop System

Closed loop tension systems provide very precise and accurate tension control during steady state running conditions as well as acceleration, deceleration, and E-stop conditions. Because the material web is monitored constantly, either by load cells or from a dancer by position, changes are detected immediately and the controlled device is changed instantaneously to maintain accurate tension control.

The two most common methods of providing closed loop tension control are via load cells that monitor the force on the web directly or via dancers, which provide tension by the load imposed by the dancer roll and dancer position and velocity are monitored, usually by a precision potentiometer. Even the most minute changes are sensed and compensated for in a closed loop system.

Closed loop tension control systems require the least amount of operator involvement during running. Normally, the operator sets only the tension level required for the material being run, once the system has been properly set up and adjusted. Closed loop system controllers compensate for changes in roll diameter and conditions, acceleration, deceleration, and machine variations.

Although closed loop tension control systems offer the most advantageous method of providing web tension control, be it dancer or load cell, there are some limitations to each type of system. In dancer systems, more space is required in the machine to accommodate the dancer arm and rollers, and some method, preferably an air cylinder and regulator, is required for loading. Load cell systems, on the other hand, require less space for mounting, but storage is non-existent for acceleration or deceleration, and balancing of all

Typical System Components

The typical components of a closed loop tension system are:

- Tension brake coupled to the unwind roll; i.e., TB, MTB, magnetic particle, pneumatic brake
- Controller to provide proper signal to control device; i.e., BXCTRL/ BX2DRV,

MCS-166/MCS-203, TCS-167/TCS-210, MCS-166/MCS-207

- Controlling element dancer pivot point sensor potentiometer

machine rollers. Web contact is required because of load cells' high sensitivity.

In general, closed loop tension control is the preferred method in more complex machines where precise tension control is required due to process requirements, such as precise registration, multiple color printing or coating to an exact thickness.

Slitter/Rewinder

Slitter/rewinders process an unlimited number of materials including paper, wires, and foils. Modularity and broad torque capability make Warner Electric the ideal system for the complete range of slitter/rewinder tensioning requirements.

Dual Output and Splicer System

Dual output tension control systems, often referred to as splicer controls, offer the user a multitude of options for the way they may be set up and used. Dual output tension controls have the capability of operating both outputs simultaneously from a single input or operating each output alternately, one being controlled by the sensing input and the other in a holding mode. This allows the controls to be used on either zero speed or flying splicers.

Control types include both analog, such as the TCS-310 dancer control and digital such as the BXCTRL. Dual output controllers work like the single output controllers, except a few more features are included to provide switching between the output channels when operated as splicer controls.

The remote/analog splicer control provides an output proportional to the input. Typically, this is an open loop controller and does not compensate for acceleration, deceleration, or E-stops in the system. In addition, it provides no compensation for out of round roll conditions or variations associated with machine functions. This is the most basic type of controller and, in many cases, requires operator intervention to compensate for changing roll conditions.

The dancer splicer control, TCS-310, has additional features to provide automatic compensation for acceleration, deceleration, E-stop, out of round roll conditions and variations in the machine functions. A three-term control loop (P-I-D) is used to provide these functions. Set-up adjustments are provided to tune the system for optimum performance and, once set, requires no additional adjustment. With the dancer splicer system, operator

involvement during a run is eliminated, and precise tension control is achieved.

The digital tension controller, BXCTRL, allows the user a multitude of functions for both the type of inputs being used and the outputs for the controlled element. Because of its modularity, the user can tailor the BXCTRL system to specific application requirements. This system can be used as an open loop controller being controlled by a manual potentiometer, a roll follower pot, or some type of analog input sensor, i.e., ultrasonic or photoelectric.

The same controller can also be used with either a dancer or load cell and

an optional input module for closed loop control. By changing the parameters, this is easily accomplished without having to change to a different control.

Depending on application requirements and the control selected, the optimum system for machine function and control can be selected.

Tension Control Systems

System Configurations

Typical Components for Splicer System

For Modular MTB Brakes Only

- Modular tension brake, MTB Series.
- Dual output tension controller, i.e., TCS-310 for dancer system, for remote/analog system, for providing current to brake magnets.
- Power supply, TCS-168, to provide control and brake power.
- Controlling element, i.e., pivot point sensor for dancer system; external pot, remote signal, or analog sensor for remote/analog controller.

For other Brake/Clutch Systems

- Tension brake, clutch, or electronic motor drive, i.e., TB's, MTB's, ATT's, magnetic particles or pneumatic.
- Tension controllers, BXCTRL and appropriate output modules and/or input modules as necessary depending on system type.
- Control element, i.e., dancer potentiometer, load cells, tachometers, or analog sensors, depending on application requirements.

Bag Making Machines

The smooth, consistent tension provided by Warner Electric tension control systems eliminates most reject bags caused by uneven reel tension. On preprinted bags, Warner Electric tension brakes and control systems allow superior registration control to keep the printed area in its optimum position.

Business Forms Press

Unique control circuitry allows Warner Electric tensioning systems to maintain exact web tension for intermittent web processing operations. From the beginning of each roll to its core, operator adjustment is unnecessary, even at the highest production speeds.

Tension Brakes and Clutches

Design Considerations and Selection

Brakes and clutches used for tensioning (constant slip) have one thing in common. Generally, heat dissipation capacity is the primary criteria for sizing, followed by torque capacity. Beyond this, each has unique sizing requirements that differ greatly. Information on particular Warner Electric tension brakes and clutches start on page 56.

Brakes (Unwinds or Payoffs)

Thermal Requirements

Thermal requirements for a brake equals web HP; which is

$$HP = \frac{\text{Tension (lbs.)} \times \text{Linear Speed (FPM)}}{33,000}$$

This energy is constant throughout the unwinding process. Although energy is a function of torque and slip speed, slip speed is at its slowest when torque required is at its greatest (full roll), and slip speed is at its fastest when torque required is at its least (core). All that is needed, then to determine thermal capacity required in an unwind brake is tension and linear speed.

Caution should be taken, however, on machines that run more than one material at different line speeds. All combinations of tensions and line speeds should be checked to insure that brake sizing satisfies the most demanding condition (i.e. – the highest web HP).

Torque Requirements

There are generally three conditions under which a brake must supply sufficient torque: running torque, E-Stop (or emergency stop) torque and controlled stop torque (normal deceleration).

a. Running Torque

This is the torque required to maintain constant tension at any point in the roll being unwound. Since torque is force x distance, with force being tension and distance being roll radius, then torque must change as radius changes if tension is to remain constant. Moreover, the maximum running torque will be at full roll, since that has the largest radius.

b. E-Stop Torque, Web Break

This is the torque required to stop the roll in the event of a web break or a safety related machine stop. There are basically two types of stop conditions to be considered: web break where only the roll inertia stop time and RPM are major considerations, and controlled E-Stop where stopping is required due to some safety related issue, but web tension must be maintained.

During web break E-Stop controlling tension is not a major concern, but getting the roll stopped in a specified time to minimize spillage. The time frame to stop may be a company specification or an OSHA requirement.

For a web break E-Stop, the torque required is a function of roll inertia, roll RPM and E-Stop time requirements.

$$T(\text{torque}) = \frac{WR^2 \times \text{RPM}}{308 \times t}$$

where T = Torque (lb.ft.)
t = E-Stop time requirement of machine

Since the roll inertia is greatest when the roll is full, this condition is normally used for calculating the worst-case E-Stop web break torque. RPM can be determined by dividing the linear speed by the roll diameter x pi (3.1416). E-Stop times as short as 2 seconds are not uncommon.

Note that if the control system is open loop (i.e. – ultra-sonic, manual, etc.), maximum E-Stop torque must be obtained by having the S-Stop switch on the machine turn the brake to full on, otherwise the torque available will only be running torque. In the closed loop mode (dancer or load cell), maximum E-Stop torque will automatically be applied.

c. E-Stop Torque, controlled

In a controlled stop, the brake must stop the roll during the time the machine stops, all the while maintaining tension on the unwind roll. This differs from web break E-Stop torque in that the brake must stop the inertia as well as continue to maintain running torque or tension.

$$T = \frac{WR^2 \times \text{RPM}}{308 \times t} + \text{Maximum Running Torque}$$

where T = Torque (lb.ft.)
t = E-Stop time requirements of machine

It should be noted that controlled stops can only be accomplished in the closed loop mode, as feedback is required to maintain tension.

For the same stopping times, the controlled E-Stop will require more torque than the web break E-Stop, due to the additional load of maintaining tension. Controlled E-Stop torque is the worst case as the stop is the much faster than normal deceleration times.

E-Stop whether it be for controlled purposes or web break is generally a set function of the machine. Caution should be made in that the faster the E-Stop requirements, the more torque that is required of the system and the more stress that is placed on the components in the machine.

All categories must be investigated to determine the maximum torque capacity required for the application.

Tension Brakes and Clutches

Design Considerations and Selection

Other Considerations

In some instances, it may be desirable to have a gear ratio from the roll shaft to the brake, with the brake on the higher speed shaft. In addition to providing a torque multiplication equal to the gear ratio, this also serves to reduce the effective inertia that the brake sees, as reflected roll inertia is reduced by the square of the ratio. Note, however, that with brakes that have a specified drag, or minimum torque, that drag torque is also multiplied, which could result in inability to address minimum running torque at or close to core diameter.

Also, it is important to realize that employing a gear ratio **DOES NOT** reduce the heat dissipation requirement of the brake.

Another instance where a gear ratio may be needed is when any friction type brake is required to run at very low speeds, usually below 50 RPM. Although today's friction materials have been perfected to the point where static and dynamic coefficients or friction are very close, a certain amount of "sticktion" or stick slip phenomena may occur to the extent that precise control of tension may be compromised. Employing a speed-up gear ratio can make the brake operate at a more efficient speed.

Clutches (Rewinds or Winders)

Although motor drives are the more common choice for winders, clutches can be used quite successfully, and offer a more economical alternative. Typically, the input to the clutch will be a fixed RPM, and can be a take-off from the main machine drive, or an independent motor. RPM input should normally be a least 10% higher than the fastest output. To calculate this, determine the core RPM at fastest line speed, and increase this by at least 10%.

The output of the clutch will start at core RPM, and will gradually decrease as the diameter builds. As in the unwind brake, torque will vary in proportion to the diameter change, but unlike the brake, torque must increase as the diameter builds and the slip speed INCREASES. Slip speed increases because the fixed input RPM doesn't change, but the output RPM keeps decreasing as the roll diameter builds.

Energy dissipation capacity is the most critical sizing criteria in a winder clutch. Creation of heat is highest at full roll, since this is where slip speed AND torque are at their maximum. Maximum heat, or thermal HP, can be found by the following formulae:

$$HP = \frac{\text{Torque}(\text{lb.ft.}) @ \text{full roll} \times \text{Slip RPM} @ \text{full roll} \times 2 \times \text{Pi}}{33,000}$$

After the clutch size is selected based on the above thermal calculation, clutch torque capacity should be checked by calculating maximum torque required, which is maximum tension times full roll radius.

Taper Tension

With some materials, taper tension may be required. This is a means by which tension is gradually decreased as the roll diameter builds, and is employed if there is a risk of crushing cores due to build-up of internal pressure within the roll, or if telescoping (slippage to one side) of the wraps might occur. This becomes a function of the control, as the rate of torque increase must be reduced as diameter increases.

In single zone machines, where the unwind brake controls winder tension, taper tension can be handled in a similar fashion.

Control of the clutch can be either open loop (manual adjust or diameter compensation) or closed loop (dancer or load cell), depending upon the degree of precision needed.

For detailed sizing and selection for unwind, intermediate and rewind applications, see sizing selection section on pages 16 through 32.

Tension Brakes and Clutches

Design Considerations and Selection

Design considerations and selection can be broken down by the type of system being selected and the function it must perform. Sizing and application for an unwind will be different than that for a rewind. Also, depending on whether it will be for a clutch, or brake or for a drive, certain system parameters will be required.

Additionally, will the system require a simple remote/analog control, or will it require the option of a closed loop dancer or load cell controller? These factors must be taken into consideration when sizing the proper system.

No matter which type of system is being considered, certain application parameters are necessary to make the calculations for selecting the proper components. The selection process is straight forward if the necessary data has been obtained.

An application data sheet should be used for each application to insure the necessary data is available when doing the calculations. In many cases, three or four data sheets may be used for a particular machine. Although this may seem excessive, parameters will often vary between unwind, intermediate, or rewind sections of the machine.

Unwind Sizing Tension Brakes

Once the selection data has been obtained, sizing and calculations can be started. An application example is included for both a brake sizing and a drive sizing, showing the comparison of the two type systems.

Application Data

Material: Paper; 30 lb. Basis weight
Tension: 36 lbs. max.
Roll weight: 1,100 lb. avg.
Web Width: 24 inches
Linear Speed: 800 ft./min.
Core diameter: 3.00 inches
Max. roll diameter: 42.00 inches
Machine Acceleration Time: 15 seconds
Machine Deceleration Time: 15 seconds
Machine E-Stop Time: 3.8 seconds

Note: Tension = Material Tension (PLI) X Web Width

Sizing for a Unwind Tension Brake System

1. Energy Rate

Energy Rate = Tension x Linear Speed

$$ER = 36 \times 800$$

$$ER = 28,800 \text{ ft. lbs./minute}$$

2. Thermal Horsepower

$$\text{Thermal HP} = \frac{\text{Energy Rate}}{\mathbf{33,000}}$$

Note: Constant values in formulas are in bold.

$$\text{HP} = \frac{28,800}{\mathbf{33,000}}$$

$$\text{HP} = 0.873 \text{ HP}$$

3. Minimum Roll Speed

$$\text{Min. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Max. Roll Diameter (in.)}}$$

$$\text{Min. Roll Speed} = \frac{800 \times \mathbf{3.82}}{42}$$

$$\text{Min. Roll Speed} = 72.76 \text{ RPM}$$

4. Maximum Roll Speed

$$\text{Max. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Core Diameter (in.)}}$$

$$\text{Max. Roll Speed} = \frac{800 \times \mathbf{3.82}}{3}$$

$$\text{Max. Roll Speed} = 1,018.67 \text{ RPM}$$

5. Selection Speed

$$\text{Selection Speed} = \frac{(\text{Max. Roll Speed} - \text{Minimum Roll Speed})}{\mathbf{10}}$$

$$+ \text{Min Roll Speed}$$

$$\text{Selection Speed} = \frac{(1,018.67 - 72.76)}{\mathbf{10}} + 72.76$$

$$\text{Selection Speed} = \frac{945.91}{\mathbf{10}} + 72.76$$

$$\text{Selection Speed} = 94.591 + 72.76$$

$$\text{Selection Speed} = 167.35 \text{ RPM (Selection Speed)}$$

Ref: Appropriate thermal curves on various catalog pages for possible brake selections (Selection Speed vs. Thermal)

6. Minimum Roll Torque

$$\text{Minimum Roll Torque} = \text{Tension} \times \frac{\text{Core Dia (in.)}}{\mathbf{24}}$$

$$\text{Minimum Roll Torque} = 36 \times \frac{3}{\mathbf{24}}$$

$$\text{Minimum Roll Torque} = 36 \times 0.125$$

$$\text{Minimum Roll Torque} = 4.5 \text{ lb. ft.}$$

7. Maximum Roll Torque

$$\text{Maximum Roll Torque} = \text{Tension} \times \frac{\text{Max. Roll Dia. (in.)}}{\mathbf{24}}$$

$$\text{Maximum Roll Torque} = 36 \times \frac{42}{\mathbf{24}}$$

$$\text{Maximum Roll Torque} = 36 \times 1.75$$

$$\text{Maximum Roll Torque} = 63.00 \text{ lb. ft.}$$

Note: Refer to appropriate Running Torque vs. Speed Curves

Tension Brakes and Clutches

Design Considerations and Selection

8. Full Roll Inertia, WR^2

$$\text{Full Roll Inertia} = \frac{\text{Weight} \times \text{Max. Dia. (in)}^2}{1152}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times (42)^2}{1152}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times 1,746}{1152}$$

$$\text{Full Roll Inertia} = \frac{1,940,400}{1152}$$

$$\text{Full Roll Inertia} = 1,684.38 \text{ lb. ft.}^2$$

9. Roll Deceleration Torque (Normal Controlled Stop)

$$\text{Roll Decel Torque} = \frac{\text{Roll Inertia} \times \text{Min. Roll Speed}}{308 \times \text{Machine Decel Time}}$$

+ Max. Running Torque

$$\text{Roll Decel Torque} = \frac{1,684.38 \times 72.76}{308 \times 15} + 63$$

$$\text{Roll Decel Torque} = \frac{122,555.49}{4,620} + 63$$

$$\text{Roll Decel Torque} = 26.53 + 63$$

$$\text{Roll Decel Torque} = 89.53 \text{ lb. ft.}$$

10. Roll E-Stop Torque, Web Break

$$\text{Roll E-Stop Torque, Web Break} = \frac{\text{Roll Inertia} \times \text{Min Roll Speed}}{308 \times \text{Machine E-Stop Time}}$$

$$\text{Roll E-Stop Torque, Web Break} = \frac{1,684.38 \times 72.76}{308 \times 3.8}$$

$$\text{Roll E-Stop Torque, Web Break} = \frac{122,555.49}{1,170.4}$$

$$\text{Roll E-Stop Torque, Web Break} = 104.71 \text{ lb. ft.}$$

- This formula can also be used to check tension during acceleration. Using acceleration time of 15 seconds, torque =

$$\frac{1,684.38 \times 72.76}{308 \times 15} = 26.5 \text{ lb. ft.}$$

Dividing this torque by the radius give tension, so

$$\text{Tension} = \frac{26.5}{(42/24)} = 15.0 \text{ lbs.}$$

Since tension requirement is 36 lbs., acceleration is OK. If acceleration tension exceeds specified tension, a powered unwind should be considered or changing the time requirements.

11. Roll E-Stop Torque, Controlled

$$\text{Roll E-Stop Torque, Controlled} = \frac{\text{Roll Inertia} \times \text{Min Roll Speed}}{308 \times \text{Machine E-Stop Time}}$$

+ Max. Running Torque

$$\text{Roll E-Stop Torque, Controlled} = \frac{1,684.38 \times 72.76 + 63}{308 \times 3.8}$$

$$\text{Roll E-Stop Torque, Controlled} = \frac{122,555.49 + 63}{1,170.4}$$

$$\text{Roll E-Stop Torque, Controlled} = 104.71 + 63$$

$$\text{Roll E-Stop Torque, Controlled} = 167.71 \text{ lb. ft.}$$

Refer: Appropriate torque vs. speed curves for selection of possible brakes.

Final brake sizing is determined by thermal vs. selection speed and torque vs. speed for both running and E-Stop conditions. These specifications are found in the brake selection sections starting on page 56.

A cross check of minimum running torque to minimum torque of the unit selected must also be made. If the brake minimum torque value is above the minimum running torque value, then either gearing between the unwind roll and the brake will be required, or a larger core diameter or higher tension value must be used.

Note: Not all types of tension brakes in this catalog may be suited for a particular application. Selecting a brake that is not capable of handling the system requirements will result in premature wear out or failure.

If in doubt about sizing and selection, contact your local Warner Electric Distributor, Warner Sales Representative, or the factory.

Note: Constant values in formulas are in bold.

Tension Control Systems

Design Considerations and Selection

Sizing for an Unwind Tension Drive System

Sizing for an unwind tension drive system is similar to a brake system; however, a few additional calculations are required to insure that the proper motor is selected. As before, the same system data is used to make the calculations and selection.

1. Energy Rate

$$\text{Energy Rate} = \text{Tension} \times \text{Linear Speed} \times \left\{ \begin{array}{l} \text{Max. Dia. (in.)} \\ \text{Min. Dia. (in.)} \end{array} \right\}$$

$$\text{Energy Rate} = 36 \times 800 \times \frac{42}{3}$$

$$\text{Energy Rate} = 36 \times 800 \times 14$$

$$\text{Energy Rate} = 403,200 \text{ ft. lbs./minute}$$

2. Thermal Horsepower

$$\text{Thermal Horsepower} = \frac{\text{Energy Rate}}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = \frac{403,200.00}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = 12.22 \text{ HP}$$

3. Minimum Roll Speed

$$\text{Min. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Max. Roll Diameter (in.)}}$$

$$\text{Min. Roll Speed} = \frac{800 \times \mathbf{3.82}}{42}$$

$$\text{Min. Roll Speed} = 72.76 \text{ RPM}$$

4. Maximum Roll Speed

$$\text{Max. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Core Diameter (in.)}}$$

$$\text{Max. Roll Speed} = \frac{800 \times \mathbf{3.82}}{3}$$

$$\text{Max. Roll Speed} = 1,018.67 \text{ RPM}$$

5. Minimum Roll Torque

$$\text{Minimum Roll Torque} = \text{Tension} \times \frac{\text{Core Dia. (in.)}}{\mathbf{24}}$$

$$\text{Minimum Roll Torque} = 36 \times \frac{3}{\mathbf{24}}$$

$$\text{Minimum Roll Torque} = 36 \times 0.125$$

$$\text{Minimum Roll Torque} = 4.5 \text{ lb. ft.}$$

6. Maximum Roll Torque

$$\text{Maximum Roll Torque} = \text{Tension} \times \frac{\text{Max. Roll Dia. (in.)}}{\mathbf{24}}$$

$$\text{Maximum Roll Torque} = 36 \times \frac{42}{\mathbf{24}}$$

$$\text{Maximum Roll Torque} = 36 \times 1.75$$

$$\text{Maximum Roll Torque} = 63.00 \text{ lb. ft.}$$

7. Full Roll Inertia, WR²

$$\text{Full Roll Inertia} = \frac{\text{Weight} \times \text{Max. Dia. (in.)}^2}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times (42)^2}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times 1,746}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = \frac{1,940,400}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = 1,684.38 \text{ lb. ft.}^2$$

8. Acceleration Torque to Start Full Roll

$$\text{Acceleration Torque} = \frac{\text{Inertia} \times \text{Min Roll Speed}}{\mathbf{308} \times \text{Machine Accel Time}}$$

$$+ \text{Max. Roll Torque}$$

$$\text{Acceleration Torque} = \frac{1,684.38 \times 72.76}{\mathbf{308} \times 15} + 63$$

$$\text{Acceleration Torque} = \frac{122,555.49}{4,620.0} + 63$$

$$\text{Acceleration Torque} = 26.53 + 63.00$$

$$\text{Acceleration Torque} = 89.53 \text{ lb.ft.}$$

9. Roll Deceleration Torque (Normal Controlled Stop)

$$\text{Roll Decel Torque} = \frac{\text{Roll Inertia} \times \text{Min. Roll Speed}}{\mathbf{308} \times \text{Machine Decel Time}}$$

$$+ \text{Max. Roll Torque}$$

$$\text{Roll Decel Torque} = \frac{1,684.38 \times 72.76}{\mathbf{308} \times 15} + 63$$

$$\text{Roll Decel Torque} = \frac{122,555.49}{4,620} + 63$$

$$\text{Roll Decel Torque} = 26.53 + 63$$

$$\text{Roll Decel Torque} = 89.53 \text{ lb. ft.}$$

10. Roll E-Stop Torque, Web Break

$$\text{Roll E-Stop Torque, Web Break} = \frac{\text{Roll Inertia} \times \text{Min Roll Speed}}{\mathbf{308} \times \text{Machine E-Stop Time}}$$

$$\text{Roll E-Stop Torque, Web Break} = \frac{1,684.38 \times 72.76}{\mathbf{308} \times 3.8}$$

Note: Constant values in formulas are in bold.

$$\text{Roll E-Stop Torque,} = \frac{122,555.49}{1,170.4}$$

Web Break

$$\text{Roll E-Stop Torque,} = 104.71 \text{ lb. ft.}$$

Web Break

11. Roll E-Stop Torque, Controlled

$$\text{Roll E-Stop Torque,} = \frac{\text{Roll Inertia} \times \text{Min Roll Speed}}{\text{Controlled } \mathbf{308} \times \text{Machine E-Stop Time}}$$

+ Max. Running Torque

$$\text{Roll E-Stop Torque,} = \frac{1,684.38 \times 72.76}{\text{Controlled } \mathbf{308} \times 3.8} + 63$$

$$\text{Roll E-Stop Torque,} = \frac{122,555.49}{\text{Controlled } 1,170.4} + 63$$

$$\text{Roll E-Stop Torque,} = 104.71 + 63$$

Controlled

$$\text{Roll E-Stop Torque, Controlled} = 167.71 \text{ lb. ft.}$$

Not only does horsepower have to be calculated on thermal capacity, but horsepower must also be calculated based on both running and E-Stop torque requirements. In many cases, this will dictate a larger horsepower rating than was previously calculated for thermal capacity.

Generally, most AC and DC motors used with a drive, as is the case with most tension systems, produce 3 lb.ft. of torque over the entire speed range. The drives also provide increased current capacity for acceleration and deceleration for short time periods in the range or 150% of nominal ratings. This translates to a torque rating of 4.5 lb. ft. per horsepower.

12. Horsepower Based on Running Torque

$$\text{Running Horsepower} = \frac{\text{Maximum Running Torque}}{\mathbf{3.0}}$$

$$\text{Running Horsepower} = \frac{63.00}{\mathbf{3.00}}$$

$$\text{Running Horsepower} = 21 \text{ HP}$$

13. Horsepower Based on E-Stop Torque

Normally controlled E-Stop torque will be the worst-case conditions for calculating this horsepower requirement.

$$\text{E-Stop Horsepower} = \frac{\text{E-Stop Torque, Controlled}}{\mathbf{3.0} \times \mathbf{1.5}}$$

$$\text{E-Stop Horsepower} = \frac{167.71}{\mathbf{4.5}}$$

$$\text{E-Stop Horsepower} = 37.27 \text{ HP}$$

As can be seen, the horsepower requirements for torque are much higher than those calculated for just thermal capacity. The motor and drive must be selected based on the largest of the three horsepower requirements.

14. Motor HP Comparisons for Thermal and Torque

$$\text{Thermal HP} = 12.22 \text{ HP}$$

$$\text{Running Torque HP} = 21.00 \text{ HP}$$

$$\text{Accel/Decel Torque HP} = 19.89 \text{ HP}$$

$$\text{E-Stop Torque HP} = 37.27$$

Based on the largest of the three requirements, in this case the E-Stop requirements of 37.27 HP; a 40 HP motor and drive system is required.

Note: Often a service factor will be added that will further increase the motor and drive size. This will generally depend on the severity of the application, environment, etc.

Service factors of 1.25 to 2.5 are typical for most applications.

Sizing and selection for different types of unwind systems, whether they be electric or pneumatic brakes, AC or DC drive systems, is basically the same. Though some differences may exist in the sizing and selection processes, most of the differences are revealed in the actual calculations, which are based on the type of system being considered. Acceleration, deceleration, and E-Stop requirements must be calculated for dancer and load cell type systems.

With analog or manual type systems, sizing process differences are not a factor, as the signal providing the control is a function of roll diameter only, and true machine function feedback is provided.

If deceleration and E-Stop capabilities are necessary to maintain accurate tension, then either a dancer or load cell type system must be considered. These are the only type systems that employ the full closed loop feedback needed for deceleration and E-Stop.

Control systems can be selected from the appropriate tables, page 38.

Note: In some cases a reducer or gearbox may be required between the motor or brake and the unwind roll spindle.

When sizing a reducer or gearbox, the speed is increased by the ratio and the torque is reduced by the ratio. Additionally, the efficiency of the reduction must be taken into account as this will slightly increase the required torque.

Note: Constant values in formulas are in bold.

Tension Control Systems

Design Considerations and Selection

Intermediate Sizing

Intermediate sizing and selection typically involves a roll that retards or pulls the web to create tension.

A brake usually provides the retarding force, while a clutch driven by a constant speed motor or a variable AC or DC drive system provides pull force.

A few additional parameters are considered in addition to those used in sizing and selecting an unwind.

Application Data

Material: Paper; 30 lb. Basis weight
Tension: 36 lbs. max.
Roll weight: 1,100 lb. avg.
Web Width: 24 inches
Linear Speed: 800 ft./min.
Core diameter: 3.00 inches
Max. roll diameter: 42.00 inches
Machine Acceleration Time: 15 seconds
Machine Deceleration Time: 15 seconds
Machine E-Stop Time: 3.8 seconds
Location of Controlling Element: Nip Rolls, S-Wrap
Roller Diameter: 6.00 inches
Roller Width: 30.00 inches
Roller Weight: 100 lbs.
Nip Roll Pressure: 25 lbs.

Sizing an Intermediate Tension Brake System

1. Nip Roll Speed

$$\text{Nip Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Nip Roll Diameter}}$$

$$\text{Nip Roll Speed} = \frac{800 \times \mathbf{3.82}}{6.00}$$

$$\text{Nip Roll Speed} = 509.33 \text{ RPM}$$

2. Tension Torque

$$\text{Tension Torque} = \text{Tension} \times \frac{\text{Nip Roll Diameter}}{\mathbf{24}}$$

$$\text{Tension Torque} = 36 \times \frac{6.00}{\mathbf{24}}$$

$$\text{Tension Torque} = 36 \times 0.25$$

$$\text{Tension Torque} = 9.00 \text{ lb. ft.}$$

3. Torque Due to Nip Roll Pressure

$$\text{Nip Roll Torque} = \text{Nip Roll Force} \times \frac{\text{Nip Roll Diameter}}{\mathbf{24}}$$

$$\text{Nip Roll Torque} = 25 \times \frac{6.00}{\mathbf{24}}$$

$$\text{Nip Roll Torque} = 25 \times 0.25$$

$$\text{Nip Roll Torque} = 6.25 \text{ lb. ft.}$$

4. Torque Required for Tensioning

$$\text{Total Torque} = \text{Tension Torque} - \text{Nip Roll Torque}$$

$$\text{Total Torque} = 9.00 - 6.25$$

$$\text{Total Torque} = 2.75 \text{ lb. ft.}$$

5. Energy Rate Required from Brake

$$\text{Energy Rate} = 2 \times \text{Pi} \times \text{Nip Roll Speed} \times \text{Nip Roll Torque}$$

$$\text{Energy Rate} = 2 \times 3.1415927 \times 509.33 \times 2.75$$

$$\text{Energy Rate} = 8,800.59 \text{ ft. lbs./minute}$$

6. Thermal Horsepower

$$\text{Thermal Horsepower} = \frac{\text{Energy Rate}}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = \frac{8,800.59}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = 0.267 \text{ HP}$$

Initial brake sizing is based on thermal requirements and operating speeds from the appropriate speed vs. thermal curves for the brake type being considered. This information is found in the brake selection section starting on page 56.

7. Normal Deceleration Torque

$$\text{Deceleration Torque} = \frac{\text{Nip Roll Inertia} \times \text{Nip Roll Speed}}{\mathbf{308} \times \text{Machine Deceleration Time}} + \text{Total Running Torque}$$

$$\text{WR}^2 = \frac{\text{Nip Roll Diameter}^2 \times \text{Nip Roll Weight}}{\mathbf{1152}}$$

$$\text{WR}^2 = \frac{6^2 \times 100}{\mathbf{1152}}$$

$$\text{WR}^2 = 3.125 \text{ lb.ft.}^2$$

$$\text{Deceleration Torque} = \frac{3.125 \times 509.33 + 2.75}{\mathbf{308} \times 15}$$

$$\text{Deceleration Torque} = \frac{1591.66 + 2.75}{4620}$$

$$\text{Deceleration Torque} = 0.345 + 2.75$$

$$\text{Deceleration Torque} = 3.095 \text{ lb. ft.}$$

8. E-Stop Torque

$$\text{E-Stop Torque} = \frac{\text{Nip Roll Inertia} \times \text{Nip Roll Speed}}{\mathbf{308} \times \text{Machine E-Stop Time}} + \text{Total Running Torque}$$

$$\text{E-Stop Torque} = \frac{3.125 \times 509.33 + 2.75}{\mathbf{308} \times 3.8}$$

Note: Constant values in formulas are in bold.

Design Considerations and Selection

$$\text{E-Stop Torque} = \frac{1591.66}{1170.4} + 2.75$$

$$\text{E-Stop Torque} = 1.36 + 2.75$$

$$\text{E-Stop Torque} = 4.11 \text{ lb. ft.}$$

Final brake selection is based on running torque and E-Stop torque, based on torque vs. speed curves. The brake must have sufficient torque capability to handle the application. The appropriate curves for the brake type being considered should be consulted.

Note: Not all brake types will be suitable for a given application.

Sizing an Intermediate Tension Clutch System

Clutch sizing for an intermediate tension system is similar to brake sizing except the clutch input speed is recommended to be 50 to 100 RPM higher than the maximum output speed to assure proper controllability.

Using the same parameters as that for the brake sizing, sizing a clutch is as follows:

1. Nip Roll Speed

$$\text{Nip Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Nip Roll Diameter}}$$

$$\text{Nip Roll Speed} = \frac{800 \times \mathbf{3.82}}{6.00}$$

$$\text{Nip Roll Speed} = 509.33 \text{ RPM}$$

2. Tension Torque

$$\text{Tension Torque} = \text{Tension} \times \frac{\text{Nip Roll Diameter}}{\mathbf{24}}$$

$$\text{Tension Torque} = 36 \times \frac{6.00}{\mathbf{24}}$$

$$\text{Tension Torque} = 36 \times 0.25$$

$$\text{Tension Torque} = 9.00 \text{ lb. ft.}$$

3. Torque Due to Nip Roll Pressure

$$\text{Nip Roll Torque} = \text{Nip Roll Force} \times \frac{\text{Nip Roll Diameter}}{\mathbf{24}}$$

$$\text{Nip Roll Torque} = 25 \times \frac{6.00}{\mathbf{24}}$$

$$\text{Nip Roll Torque} = 25 \times 0.25$$

$$\text{Nip Roll Torque} = 6.25 \text{ lb. ft.}$$

4. Total Torque Required for Tensioning

$$\text{Total Torque} = \text{Tension Torque} + \text{Nip Roll Torque}$$

$$\text{Total Torque} = 9.00 + 6.25$$

$$\text{Total Torque} = 15.25 \text{ lb. ft.}$$

Note: Constant values in formulas are in bold.

5. Clutch Input Speed

$$\text{Clutch Input Speed} = \frac{k \times \text{Linear Speed}}{\text{Nip Roll Diameter}}$$

$$k = 4.2 \text{ for } 50 \text{ RPM Slip Difference}$$

$$k = 4.57 \text{ for } 100 \text{ RPM Slip Difference}$$

$$\text{Clutch Input Speed} = \frac{4.57 \times 800}{6}$$

$$\text{Clutch Input Speed} = \frac{3656}{6}$$

$$\text{Clutch Input Speed} = 609.33 \text{ RPM}$$

6. Energy Rate

$$\text{Energy Rate} = 2 \times (\text{Pi}) \pi \times \text{Total Torque} \times \frac{\text{Slip Speed}}{\text{Difference}}$$

$$\text{Energy Rate} = 2 \times 3.1415927 \times 15.25 \times 100$$

$$\text{Energy Rate} = 9,581.86 \text{ ft. lbs./minute}$$

7. Thermal Horsepower

$$\text{Thermal Horsepower} = \frac{\text{Energy Rate}}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = \frac{9,581.86}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = 0.3 \text{ HP}$$

8. Acceleration Torque

$$\text{Acceleration Torque} = \frac{\text{Nip Roll Inertia} \times \text{Nip Roll Speed}}{\mathbf{308} \times \text{Machine Acceleration Time}}$$

$$+ \text{Total Running Torque}$$

$$\text{Acceleration Torque} = \frac{3.125 \times 509.33}{\mathbf{308} \times 15} + 15.25$$

$$\text{Acceleration Torque} = \frac{1591.66}{4620} + 15.25$$

$$\text{Acceleration Torque} = 0.345 + 15.25$$

$$\text{Acceleration Torque} = 15.595 \text{ lb. ft.}$$

Final clutch sizing is based on running torque and acceleration torque requirements that are based on slip RPM between input and output. The appropriate torque vs. speed curves should be consulted to insure that the clutch being considered has the necessary torque capacity for the application. See clutch information starting on page 60.

Not every model of clutch will be suitable for a given application.

Tension Control Systems

Design Considerations and Selection

Sizing an Intermediate Tension Drive System

Sizing a tension drive system for an intermediate tension zone is as easy as sizing a clutch or brake. Often a reducer or gear head will be used between the motor and nip rolls being controlled.

Using the same application parameters as that for the previous brake and clutch, sizing a drive is as follows:

1. Nip Roll Speed

$$\text{Nip Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Nip Roll Diameter}}$$

$$\text{Nip Roll Speed} = \frac{800 \times \mathbf{3.82}}{6.00}$$

$$\text{Nip Roll Speed} = 509.33 \text{ RPM}$$

2. Tension Torque

$$\text{Tension Torque} = \text{Tension} \times \frac{\text{Nip Roll Diameter}}{\mathbf{24}}$$

$$\text{Tension Torque} = 36 \times \frac{6.00}{\mathbf{24}}$$

$$\text{Tension Torque} = 36 \times 0.25$$

$$\text{Tension Torque} = 9.00 \text{ lb. ft.}$$

3. Torque Due to Nip Roll Pressure

$$\text{Nip Roll Torque} = \text{Nip Roll Force} \times \frac{\text{Nip Roll Diameter}}{\mathbf{24}}$$

$$\text{Nip Roll Torque} = 25 \times \frac{6.00}{\mathbf{24}}$$

$$\text{Nip Roll Torque} = 25 \times 0.25$$

$$\text{Nip Roll Torque} = 6.25 \text{ lb. ft.}$$

4. Total Torque Required for Tensioning

$$\text{Total Torque} = \text{Tension Torque} + \text{Nip Roll Torque}$$

$$\text{Total Torque} = 9.00 + 6.25$$

$$\text{Total Torque} = 15.25 \text{ lb. ft.}$$

5. Energy Rate

$$\text{Energy Rate} = 2 \times (\text{Pi}) \pi \times \text{Total Torque} \times \text{Nip Roll RPM}$$

$$\text{Energy Rate} = 2 \times 3.1415927 \times 15.25 \times 509.33$$

$$\text{Energy Rate} = 48,803.3 \text{ ft. lbs./minute}$$

6. Thermal Horsepower

$$\text{Thermal Horsepower} = \frac{\text{Energy Rate}}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = \frac{48,803.3}{\mathbf{33,000}}$$

$$\text{Thermal Horsepower} = 1.48 \text{ HP}$$

Initial motor selection would be for a 1.5 HP. However, this must be checked to insure that the motor will have sufficient torque capacity to handle the application.

In this application, a ratio between the nip rolls and the motor would be advantageous as it will allow the motor to operate closer to its base speed of 1,750 RPM.

To determine the ratio for the reducer or gear head, assume the maximum motor speed is 1,750 RPM.

7. Reduction Ratio between Motor and Nip Rolls

$$\text{Reduction Ratio} = \frac{\text{Motor Base Speed}}{\text{Nip Roll Speed}}$$

$$\text{Reduction Ratio} = \frac{1750}{509.33}$$

$$\text{Reduction Ratio} = 3.44 : 1$$

Based on this maximum ratio of 3.44 to 1, a 3:1 ratio would be selected for use between the motor and nip rolls. This would be a standard ratio and would be more readily available in comparison to a 3.44:1 ration.

8. Acceleration Torque

$$\text{Acceleration Torque} = \frac{\text{Nip Roll Inertia} \times \text{Nip Roll Speed}}{\mathbf{308} \times \text{Machine Acceleration Time}}$$

$$+ \text{Total Running Torque}$$

$$\text{Acceleration Torque} = \frac{3,125 \times 509.33}{\mathbf{308} \times 15} + 15.25$$

$$\text{Acceleration Torque} = \frac{1591.66}{4620} + 15.25$$

$$\text{Acceleration Torque} = 0.345 + 15.25$$

$$\text{Acceleration Torque} = 15.595 \text{ lb. ft.}$$

9. Deceleration Torque

$$\text{Deceleration Torque} = \frac{\text{Nip Roll Inertia} \times \text{Nip Roll Speed}}{\mathbf{308} \times \text{Machine Deceleration Time}}$$

$$+ \text{Total Running Torque}$$

$$\text{Deceleration Torque} = \frac{3,125 \times 509.33}{\mathbf{308} \times 15} + 15.25$$

$$\text{Deceleration Torque} = \frac{1591.66}{4620} + 15.25$$

$$\text{Deceleration Torque} = 0.345 + 15.25$$

$$\text{Deceleration Torque} = 15.595 \text{ lb. ft.}$$

Note: Constant values in formulas are in bold.

Design Considerations and Selection

10. E-Stop Torque

$$\text{E-Stop Torque} = \frac{\text{Nip Roll Inertia} \times \text{Nip Roll Speed}}{\mathbf{308} \times \text{Machine E-Stop Time}} + \text{Total Running Torque}$$

$$\text{E-Stop Torque} = \frac{3.125 \times 509.33}{\mathbf{308} \times 3.8} + 15.25$$

$$\text{E-Stop Torque} = \frac{1591.66}{1170.4} + 15.25$$

$$\text{E-Stop Torque} = 1.36 + 15.25$$

$$\text{E-Stop Torque} = 16.61 \text{ lb. ft.}$$

Because a 3:1 reduction is used between the nip rolls and motor, the reflected torque the motor must produce is reduced by this ratio.

11. Running Torque reflected to Motor with ratio

$$\text{Motor Run Torque}_{(\text{reflected})} = \frac{\text{Roll Running Torque}}{\frac{\text{Ratio}}{\text{Efficiency of Reduction}}}$$

$$\text{Motor Run Torque}_{(\text{reflected})} = \frac{15.25}{\frac{3.00}{0.85}}$$

$$\text{Motor Run Torque}_{(\text{reflected})} = 5.98 \text{ lb. ft.}$$

12. Acceleration Torque reflected to Motor with ratio

$$\text{Motor Accel Torque}_{(\text{reflected})} = \frac{\text{Roll Acceleration Torque}}{\frac{\text{Ratio}}{\text{Efficiency of Reduction}}}$$

$$\text{Motor Accel Torque}_{(\text{reflected})} = \frac{15.595}{\frac{3.00}{0.85}}$$

$$\text{Motor Accel Torque}_{(\text{reflected})} = 6.12 \text{ lb. ft.}$$

13. Deceleration Torque reflected to Motor with ratio

$$\text{Motor Decel Torque}_{(\text{reflected})} = \frac{\text{Roll Acceleration Torque}}{\frac{\text{Ratio}}{\text{Efficiency of Reduction}}}$$

$$\text{Motor Decel Torque}_{(\text{reflected})} = \frac{15.595}{\frac{3.00}{0.85}}$$

$$\text{Motor Decel Torque}_{(\text{reflected})} = 6.12 \text{ lb. ft.}$$

14. E-Stop Torque reflected to Motor with ratio

$$\text{Motor E-Stop Torque}_{(\text{reflected})} = \frac{\text{Roll E-Stop Torque}}{\frac{\text{Ratio}}{\text{Efficiency of Reduction}}}$$

$$\text{Motor E-Stop Torque}_{(\text{reflected})} = \frac{16.61}{\frac{3.00}{0.85}}$$

$$\text{Motor E-Stop Torque}_{(\text{reflected})} = 6.514 \text{ lb. ft.}$$

Note: Constant values in formulas are in bold.

The final selection of the motor is based on the torque/HP capabilities. Motors will normally produce 3 lb.ft. of torque per HP over the speed range when used with either an AC or DC drive. Knowing this, horsepower requirements can be based on the various torque requirements and the motor selected accordingly. Additionally, most AC and DC drives provide a 150% overload capability for a limited time for acceleration, deceleration, and E-Stop conditions.

15. Motor HP based on Running Torque

$$\text{Motor HP} = \frac{\text{Running Torque}}{\mathbf{3.00}}$$

$$\text{Motor HP} = \frac{5.98}{\mathbf{3.00}}$$

$$\text{Motor HP} = 1.99 \text{ HP}$$

16. Motor HP based on Acceleration Torque

$$\text{Motor HP} = \frac{\text{Acceleration Torque}}{\mathbf{4.50}}$$

$$\text{Motor HP} = \frac{6.12}{\mathbf{4.50}}$$

$$\text{Motor HP} = 1.36 \text{ HP}$$

17. Motor HP based on Deceleration Torque

$$\text{Motor HP} = \frac{\text{Deceleration Torque}}{\mathbf{4.50}}$$

$$\text{Motor HP} = \frac{6.12}{\mathbf{4.50}}$$

$$\text{Motor HP} = 1.36 \text{ HP}$$

18. Motor HP based on E-Stop Torque

$$\text{Motor HP} = \frac{\text{E-Stop Torque}}{\mathbf{4.50}}$$

$$\text{Motor HP} = \frac{6.514}{\mathbf{4.50}}$$

$$\text{Motor HP} = 1.45 \text{ HP}$$

19. Motor HP Comparisons for Thermal and Torque

$$\text{Thermal HP} = 1.48 \text{ HP}$$

$$\text{Running Torque HP} = 1.99 \text{ HP}$$

$$\text{Accel/Decel Torque HP} = 1.36 \text{ HP}$$

$$\text{E-Stop Torque HP} = 1.45$$

Tension Control Systems

Design Considerations and Selection

20. Minimum Motor Horsepower Selection

Minimum Motor Horsepower Selected = 2.00 HP.

This would be the absolute minimum motor horsepower that would satisfy the requirements for this application.

Note: The 2 HP motor sized does not take into account any type of service factor for the application. Typically a service factor or 1.5 to 2.5 depending on the severity of the application, environment, hours per day operated, etc. are not unrealistic.

By adding a service factor to the final requirements, you can handle any additional friction, drag, etc. that may not be known and can be handled safely. Additionally, this will also help improve the life of the motor and system as well.

Using a service factor of 1.5 in this case, the motor HP would be $2 \times 1.5 = 3.00$ HP for final motor size selection. This would be much more preferred over using a 2 HP in this particular application.

Rewind Sizing

Rewind tension systems are different from unwind tension systems only in that the material is being rewound on a roll. Many of the calculations are similar. However, rewind tension systems will use either a tension clutch or tension drive.

Selection data required for sizing a tension rewind system is similar to that of an unwind system. The application data form under the rewind section can be used for obtaining the proper data.

For purposes of our application example, the parameters used on the previous unwind and intermediate sections will be used.

Application Data

Material: Paper; 30 lb. Basis weight
 Tension: 36 lbs. max.
 Roll weight: 1,100 lb. avg.
 Web Width: 24 inches
 Linear Speed: 800 ft./min.
 Core diameter: 3.00 inches
 Max. roll diameter: 42.00 inches
 Machine Acceleration Time: 15 seconds
 Machine Deceleration Time: 15 seconds
 Machine E-Stop Time: 3.8 seconds
 Taper Tension Requirements: None

Note: Tension = Material Tension (PLI) X Web Width

Sizing for a Rewind Tension Clutch System

1. Energy Rate

$$\text{Energy Rate} = \text{Tension} \times \text{Linear Speed} \times \left\{ \begin{array}{l} \text{Max. Dia. (in.)} \\ \text{Min. Dia (in.)} \end{array} \right\}$$

$$\text{Energy Rate} = 36 \times 800 \times \frac{42}{3}$$

$$\text{Energy Rate} = 36 \times 800 \times 14$$

$$\text{Energy Rate} = 403,200 \text{ ft. lbs./minute}$$

2. Thermal Horsepower

$$\text{Thermal Horsepower} = \frac{\text{Energy Rate}}{33,000}$$

$$\text{Thermal Horsepower} = \frac{403,200.00}{33,000}$$

$$\text{Thermal Horsepower} = 12.22 \text{ HP}$$

3. Minimum Roll Speed

$$\text{Min. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Max. Roll Diameter (in.)}}$$

$$\text{Min. Roll Speed} = \frac{800 \times \mathbf{3.82}}{42}$$

$$\text{Min. Roll Speed} = 72.76 \text{ RPM}$$

Note: Constant values in formulas are in bold.

4. Maximum Roll Speed

$$\text{Max. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Core Diameter (in.)}}$$

$$\text{Max. Roll Speed} = \frac{800 \times \mathbf{3.82}}{3}$$

$$\text{Max. Roll Speed} = 1,018.67 \text{ RPM}$$

5. Clutch Input Speed

$$\text{Clutch Input Speed} = \text{Maximum Roll Speed} + \text{Slip}$$

Note: Slip Minimum = 50 RPM
 Slip Maximum = 100 RPM

$$\text{Clutch Input Speed} = 1018.67 + 50$$

$$\text{Clutch Input Speed} = 1068.67 \text{ RPM}$$

Note: Clutch input speed must be at least 50 RPM greater than the maximum roll speed to provide a slip difference for controlling the output. If a locked rotor condition is used, the slip torque cannot be controlled, especially at core diameter.

6. Slip Speed at Core

$$\text{Slip Speed at Core} = \text{Clutch Input Speed} - \text{Maximum Roll Speed}$$

$$\text{Slip Speed at Core} = 1068.67 - 1018.67$$

$$\text{Slip Speed at Core} = 50 \text{ RPM}$$

7. Slip Speed at Full Roll

$$\text{Slip Speed at Full Roll} = \text{Clutch Input Speed} - \text{Minimum Roll Speed}$$

$$\text{Slip Speed at Full Roll} = 1068.68 - 72.76$$

$$\text{Slip Speed at Full Roll} = 995.91 \text{ RPM}$$

Thermal selection curves for the appropriate clutches should be checked to insure the clutch chosen can handle the thermal requirements at the worst case slip speed. See clutch information starting on page 60.

In this example, a slip speed of 995.91 RPM and a thermal capacity of 12.22 HP would be checked against the curves to insure that the clutch selected would have sufficient capacity to handle these requirements.

8. Minimum Torque at core

$$\text{Minimum Roll Torque} = \text{Tension} \times \frac{\text{Core Dia (in.)}}{24}$$

$$\text{Minimum Roll Torque} = 36 \times \frac{3}{24}$$

$$\text{Minimum Roll Torque} = 36 \times 0.125$$

$$\text{Minimum Roll Torque} = 4.5 \text{ lb. ft.}$$

Tension Control Systems

Design Considerations and Selection

9. Maximum Torque at full roll

$$\text{Maximum Roll Torque} = \text{Tension} \times \frac{\text{Max. Roll Dia. (in.)}}{24}$$

$$\text{Maximum Roll Torque} = 36 \times \frac{42}{24}$$

$$\text{Maximum Roll Torque} = 36 \times 1.75$$

$$\text{Maximum Roll Torque} = 63.00 \text{ lb. ft}$$

Once maximum running torque has been determined, refer the appropriate clutch torque curves to insure that the clutch has sufficient torque at the maximum slip speed. Clutch information starts on page 56.

If the clutch selected initially does not have sufficient torque at the maximum slip speed, the next larger size unit should be checked and selected.

Acceleration torque is the final step that must be considered when selecting a clutch for a rewind application. Acceleration torque for starting the roll is in addition to the running torque needed to maintain web tension.

Worst case for acceleration torque occurs when the roll is near its maximum roll diameter. If worst-case conditions can be met, there will be no problems when starting the roll at core diameter.

10. Acceleration Torque at Full Roll

$$\text{Acceleration Torque} = \frac{\text{Full Roll Inertia} \times \text{Full Roll Speed}}{308 \times \text{Machine Acceleration Time}} + \text{Maximum Run Torque}$$

$$\text{Full Roll Inertia} = \frac{\text{Full Roll Weight} \times \text{Max. Roll Dia}^2(\text{in.})}{1152}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times 42^2}{1152}$$

$$\text{Full Roll Inertia} = 1,684.375 \text{ lb. ft.}^2$$

$$\text{Acceleration Torque} = \frac{1,684.375 \times 72.76}{308 \times 15} + 63.00$$

$$\text{Acceleration Torque} = \frac{122,555.13}{4620} + 63.00$$

$$\text{Acceleration Torque} = 26.527 + 63.00$$

$$\text{Acceleration Torque} = 89.53 \text{ lb. ft.}$$

This torque is required at the maximum slip speed of the clutch to insure the roll can be accelerated while under tension.

As can be seen, the thermal requirements for a rewind clutch are much higher than those required for the same application in an unwind situation.

Generally if the roll build diameter exceeds a 3:1 range, it is more than likely that a clutch will not be sufficient for a rewind application.

Note: Constant values in formulas are in bold.

If in doubt during the sizing and selection, do not hesitate to contact your Warner Electric Distributor, Warner Electric Sales Representative, or the factory directly.

Sizing for a Rewind Tension Drive System

Sizing a motor for a rewind drive application is almost identical to that of an unwind system.

In this example, tension is constant to simplify sizing. In many applications, taper tension may be required due to the material being processed.

1. Energy Rate

$$\text{Energy Rate} = \text{Tension} \times \text{Linear Speed} \times \left\{ \begin{array}{l} \text{Max. Dia. (in.)} \\ \text{Min. Dia. (in.)} \end{array} \right\}$$
$$\text{Energy Rate} = 36 \times 800 \times \frac{42}{3}$$

$$\text{Energy Rate} = 36 \times 800 \times 14$$

$$\text{Energy Rate} = 403,200.00 \text{ ft. lbs./minute}$$

2. Thermal Horsepower

$$\text{Thermal Horsepower} = \frac{\text{Energy Rate}}{33,000}$$

$$\text{Thermal Horsepower} = \frac{403,200.00}{33,000}$$

$$\text{Thermal Horsepower} = 12.22 \text{ HP}$$

3. Minimum Roll Speed

$$\text{Min. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Max. Roll Diameter (in.)}}$$

$$\text{Min. Roll Speed} = \frac{800 \times \mathbf{3.82}}{42}$$

$$\text{Min. Roll Speed} = 72.76 \text{ RPM}$$

4. Maximum Roll Speed

$$\text{Max. Roll Speed} = \frac{\text{Linear Speed} \times \mathbf{3.82}}{\text{Core Diameter (in.)}}$$

$$\text{Max. Roll Speed} = \frac{800 \times \mathbf{3.82}}{3}$$

$$\text{Max. Roll Speed} = 1,018.67 \text{ RPM}$$

5. Minimum Roll Torque

$$\text{Minimum Roll Torque} = \text{Tension} \times \frac{\text{Core Dia (in.)}}{24}$$

$$\text{Minimum Roll Torque} = 36 \times \frac{3}{24}$$

$$\text{Minimum Roll Torque} = 36 \times 0.125$$

$$\text{Minimum Roll Torque} = 4.5 \text{ lb. ft.}$$

6. Maximum Roll Torque

$$\text{Maximum Roll Torque} = \text{Tension} \times \frac{\text{Max. Roll Dia. (in.)}}{\mathbf{24}}$$

$$\text{Maximum Roll Torque} = 36 \times \frac{42}{\mathbf{24}}$$

$$\text{Maximum Roll Torque} = 36 \times 1.75$$

$$\text{Maximum Roll Torque} = 63.00 \text{ lb. ft.}$$

7. Full Roll Inertia, WR^2

$$\text{Full Roll Inertia} = \frac{\text{Weight} \times \text{Max. Dia. (in.)}^2}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times (42)^2}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = \frac{1,100 \times 1,746}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = \frac{1,940,400}{\mathbf{1152}}$$

$$\text{Full Roll Inertia} = 1,684.38 \text{ lb. ft.}^2$$

8. Acceleration Torque to Start Full Roll

$$\text{Acceleration Torque} = \frac{\text{Inertia} \times \text{Min Roll Speed}}{\mathbf{308} \times \text{Machine Accel Time}} + \text{Max. Roll Torque}$$

$$\text{Acceleration Torque} = \frac{1,684.38 \times 72.76}{\mathbf{308} \times 15} + 63$$

$$\text{Acceleration Torque} = \frac{122,555.49}{4,620.0} + 63$$

$$\text{Acceleration Torque} = 26.53 + 63.00$$

$$\text{Acceleration Torque} = 89.53 \text{ lb.ft.}$$

9. Roll Deceleration Torque (Normal Controlled Stop)

$$\text{Roll Decel Torque} = \frac{\text{Roll Inertia} \times \text{Min. Roll Speed}}{\mathbf{308} \times \text{Machine Decel Time}} + \text{Max. Running Torque}$$

$$\text{Roll Decel Torque} = \frac{1,684.38 \times 72.76}{\mathbf{308} \times 15} + 63$$

$$\text{Roll Decel Torque} = \frac{122,555.49}{4,620} + 63$$

$$\text{Roll Decel Torque} = 26.53 + 63$$

$$\text{Roll Decel Torque} = 89.53 \text{ lb. ft.}$$

10. Roll E-Stop Torque, Controlled

$$\text{Roll E-Stop Torque, Controlled} = \frac{\text{Roll Inertia} \times \text{Min Roll Speed}}{\mathbf{308} \times \text{Machine E-Stop Time}} + \text{Max. Running Torque}$$

$$\text{Roll E-Stop Torque, Controlled} = \frac{1,684.38 \times 72.76}{\mathbf{308} \times 3.8} + 63$$

$$\text{Roll E-Stop Torque, Controlled} = \frac{122,555.49}{1,170.4} + 63$$

$$\text{Roll E-Stop Torque, Controlled} = 104.71 + 63$$

$$\text{Roll E-Stop Torque, Controlled} = 167.71 \text{ lb. ft.}$$

11. Horsepower Based on Running Torque

$$\text{Running Horsepower} = \frac{\text{Maximum Running Torque}}{\mathbf{3.0}}$$

$$\text{Running Horsepower} = \frac{63.00}{\mathbf{3.00}}$$

$$\text{Running Horsepower} = 21 \text{ HP}$$

12. Motor HP based on Acceleration Torque

$$\text{Motor HP} = \frac{\text{Acceleration Torque}}{\mathbf{4.50}}$$

$$\text{Motor HP} = \frac{89.53}{\mathbf{4.50}}$$

$$\text{Motor HP} = 19.89 \text{ HP}$$

13. Motor HP based on Deceleration Torque

$$\text{Motor HP} = \frac{\text{Deceleration Torque}}{\mathbf{4.50}}$$

$$\text{Motor HP} = \frac{89.53}{\mathbf{4.50}}$$

$$\text{Motor HP} = 19.89 \text{ HP}$$

14. Horsepower Based on E-Stop Torque

Normally controlled E-Stop torque will be the worst-case conditions for calculating this horsepower requirement.

$$\text{E-Stop Horsepower} = \frac{\text{E-Stop Torque, Controlled}}{\mathbf{3.0} \times 1.5}$$

$$\text{E-Stop Horsepower} = \frac{167.71}{\mathbf{4.5}}$$

$$\text{E-Stop Horsepower} = 37.27 \text{ HP}$$

15. Motor HP Comparisons for Thermal and Torque

$$\text{Thermal HP} = 12.22 \text{ HP}$$

$$\text{Running Torque HP} = 21.00 \text{ HP}$$

$$\text{Accel/Decel Torque HP} = 19.89 \text{ HP}$$

$$\text{E-Stop Torque HP} = 37.27$$

Note: Constant values in formulas are in bold.

Tension Control Systems

Design Considerations and Selection

Not only must the motor selected be able to handle the heat dissipation of the application, but it also must be capable of providing the necessary torque to maintain proper tension.

Typically an AC or DC motor controlled by a frequency and/or vector drive, or a regenerative DC drive produces 3 lb.ft. of torque per horsepower over the rated motor speed range.

The HP ratings based on the largest of the 4 conditions of step 15 would be the HP rating selected for the application. In this case, since a 37.27 HP motor is not a standard, the next larger size motor would be selected. This application would require a 40 HP motor and drive system.

In many applications a reduction or gear head would be used between the motor and rewind roll. Often this will reduce the HP rating of the required motor as a torque advantage is realized with the reducer or gear head. It should be noted that the maximum ratio that can be used should never exceed a 30:1 ratio or problems will result at the low-end torque range of the motor possibly.

In the example above, no service factor was taken into account and in many cases a service factor of 1.25 to 2.5 may be considered. This would take into account any unknown friction, bearing drag, etc. in the system.

In this example if a service factor of 1.25 is used, then the motor HP and drive system would be 50 HP. By going to the larger system, motor life and trouble free operation would be realized.

For additional assistance in sizing and selecting a tension rewind drive system contact your Warner Electric Authorized Distributor, Warner Electric Sales Representative, or the factory technical support.

Tension Control Systems

Design Considerations and Selection

Calculating Web Tensions

For sizing any clutch, brake or drive tension system, tension must be known to perform the calculations. In many cases, the tension ranges for the materials being processed will be known. However, tensions may have to be calculated and/or even estimated for a given application.

To determine an estimated tension value when the actual value is unknown, certain parameters must be known. These are:

1. Material being processed
2. Web width of material, minimum and maximum
3. Paper weights, material thickness or gauge, or wire diameter, or paperboard points

Approximate Tension value = Web Width x Approximate Material Tension

Note: When dealing with film and foil materials, tension values given are normally pounds per mil per inch of material width.

Approximate Tension Values

The values shown are typically for unwind and intermediate tension systems. Values for rewind systems are normally 1.5 to 2 times higher in many cases, especially when dealing with slitter-rewinders.

Tension Value Charts

| Material | Tension Pounds per inch of web width |
|--|--|
| Paper (Based on 3,000 sq. ft. / ream) | |
| 15 lb. | 0.50 lb./in. |
| 20 lb. | 0.67 lb./in. |
| 30 lb. | 1.00 lb./in. |
| 40 lb. | 1.33 lb./in. |
| 50 lb. | 1.67 lb./in. |
| 60 lb. | 2.00 lb./in. |
| 70 lb. | 2.33 lb./in. |
| 80 lb. | 2.67 lb./in. |
| 100 lb. | 3.33 lb./in. |
| 120 lb. | 4.00 lb./in. |
| 140 lb. | 4.67 lb./in. |
| 160 lb. | 5.33 lb./in. |
| 180 lb. | 6.00 lb./in. |
| 200 lb. | 6.67 lb./in. |
| Paperboard (Based on points thickness) | |
| 8 pt. | 3.00 lb./in. |
| 10 pt. | 3.75 lb./in. |
| 12 pt. | 4.75 lb./in. |
| 15 pt. | 5.63 lb./in. |
| 20 pt. | 6.00 lb./in. |
| 25 pt. | 9.38 lb./in. |
| 30 pt. | 11.25 lb./in. |
| 35 pt. | 13.13 lb./in. |
| 40 pt. | 15.00 lb./in. |
| 45 pt. | 16.88 lb./in. |
| 50 pt. | 18.75 lb./in. |

Note: Typical tension is 0.375 lbs./point

| Material | Tension Pounds per mil of web width |
|---|---|
| Films and Foils | |
| Aluminum Foil | 0.5 to 1.5 lbs./mil./in. Typically 1.0 lb./mil./in. |
| Acetate | 0.50 lbs./mil./inch |
| Cellophane | 0.50 to 1.0 lbs./mil./in. Typically 0.75 lbs./mil./in. |
| Polyester | 0.50 to 1.0 lbs./mil./in. Typically 0.75 lbs./mil./in. |
| Polyethylene | 0.25 to 0.3 lbs./mil./in. |
| Polypropylene (Non-orientated) | 0.25 to 0.3 lbs./mil./in. |
| Propylene (Oriented) | 0.5 lbs./mil./in. |
| Polystyrene | 1.0 lbs./mil./in. |
| Saran | 0.05 to 0.2 lbs./mil./in. Typically 0.1 lb./mil./in. |
| Vinyl | 0.05 to 0.2 lbs./mil./in. Typically 0.1 lb./mil./in. |
| Mylar | 0.5 lbs./mil./in. |
| Oriented Propylene | 0.5 lbs./mil./in. |
| Metals and Steels | |
| Beryllium Copper | 8.0 lbs./mil./in. |
| Titanium, Tungsten, High Carbon Steel, and Stainless Steel | 8.0 lbs./mil./in. |
| Low Carbon Steels | See Chart |
| Non-Ferrous Metals | See Chart |

| Thickness | Low Carbon Steels (lbs./in. width) | Non-Ferrous Metals (lbs./in. width) |
|-----------|---------------------------------------|--|
| 0.005 | 30.00 | 22.00 |
| 0.010 | 65.00 | 42.00 |
| 0.015 | 70.00 | 59.00 |
| 0.020 | 85.00 | 70.00 |
| 0.025 | 105.00 | 80.00 |
| 0.030 | 120.00 | 90.00 |
| 0.035 | 134.00 | 98.00 |
| 0.040 | 145.00 | 105.00 |
| 0.045 | 158.00 | 110.00 |
| 0.050 | 170.00 | 115.00 |
| 0.055 | 180.00 | 120.00 |
| 0.060 | 190.00 | 125.00 |
| 0.065 | 195.00 | 130.00 |
| 0.070 | 202.00 | 135.00 |
| 0.075 | 206.00 | 139.00 |
| 0.080 | 210.00 | 142.00 |
| 0.085 | 212.00 | 146.00 |
| 0.090 | 215.00 | 150.00 |
| 0.095 | 217.00 | 152.00 |
| 0.100 | 219.00 | 155.00 |
| 0.110 | 220.00 | |
| 0.120 | 220.00 | |
| 0.130 | 218.00 | |
| 0.140 | 214.00 | |
| 0.150 | 210.00 | |

Note: These values are for actual tensions; typically they are run at less.

Tension Control Systems

Design Considerations and Selection

Wire Tensions

| AWG Wire Size | Aluminum Wire | Copper Wire |
|---------------|---|-------------|
| | Tension Pounds per strand of wire | |
| 30 AWG | 0.35 | 1.2 |
| 28 AWG | 0.69 | 2.2 |
| 26 AWG | 1.10 | 3.3 |
| 24 AWG | 1.75 | 5.0 |
| 22 AWG | 2.77 | 7.5 |
| 20 AWG | 4.42 | 11.5 |
| 18 AWG | 7.00 | 17.0 |
| 16 AWG | 11.20 | 26.0 |
| 14 AWG | 17.80 | 38.0 |
| 12 AWG | 28.30 | 56.5 |
| 10 AWG | 44.80 | 81.0 |
| 8 AWG | 71.40 | 110.0 |
| 6 AWG | 113.00 | 175.0 |
| 4 AWG | 180.00 | 278.0 |

Note: In many cases, only hold back is required rather than full tensioning where there is a permanent set in the material. The actual tension values times a factor of 0.25 to 0.50 is sufficient to provide the necessary holdback.

Material Densities

When the weights of the unwind or rewind rolls are not known, they can be estimated by knowing the roll width, core diameter, maximum roll diameter, material type and material density.

Roll weights can be obtained by looking at the process tracking tags found on most rolls. When this is not possible, an estimated weight can be calculated.

Roll weight must be known to calculate roll inertia for acceleration, deceleration, and E-stop requirements for system selection.

Roll weight = Roll Volume x Material Density

Volume = Max Roll Diameter² x Roll Width x 0.00045

Note: Maximum Roll Diameter and Roll Width are in inches.

Application Example

Determine the estimated roll weight of a 42 inch diameter roll, 24 inches wide, paper.

Volume = 42² x 24 x 0.00045
= 19.05 cubic feet

Weight = Volume x Density
= 19.05 x 57 (Density of Paper)
= 1,086 pounds

Note: This does not take into account the core spindle shaft weight. If an extremely accurate weight of all components is necessary, core spindle shaft weight can be calculated separately and added to the roll weight.

Material Densities

| Material | Typical Density (lbs./ft. ³) |
|---------------------------------|--|
| Papers, Films, and Foils | |
| Paper | 57.00-75.00 |
| Paperboard | 88.00 |
| Acetate | 81.50 |
| Aluminum Foil | 45.00 |
| Cellophane | 57.00 |
| Polyester | 78.00 |
| Polyethylene | 57.50 |
| Polypropylene | 56.00 |
| Polystyrene | 66.00 |
| Vinyl | 86.00 |
| Saran | 107.50 |
| Mylar | 112.00 |
| Metals | |
| Aluminum | 165.00 |
| Beryllium Copper | 514.00 |
| Copper | 542.00-576.00 |
| Tin | 407.50 |
| Titanium | 281.00 |
| Tungsten | 1,224.00 |
| Steel (typical) | 483.00-495.00 |

Additional Design Considerations

Considerations additional to the sizing process for the controlling device (brakes or clutches) are discussed below.

Torque

Although torque calculations are similar for unwind, intermediate and rewind tension applications, both minimum and maximum torque values of the controlling device must be considered for the application to be successful.

Minimum torque is the amount of force the controlling device must apply to maintain constant tension in the web. If the minimum torque exceeds the minimum torque necessary to maintain web tension, the system cannot control properly, web tension will increase, and waste may result.

Maximum torque is the force provided by the controlling device to maintain proper web tension in worst-case conditions. If maximum torque is less than that required by the application, tension will be less than desirable and may result in poor process.

E-Stop torque is the force the controlling device can apply during machine E-Stop conditions. This E-Stop torque depends on the type of controlling device used and the control system employed. Not all control systems or controlling devices, i.e., brakes, clutches, etc., have E-Stop capabilities. If E-Stop requirements are mandated by the application, then both the controller system and controlling device must have the capabilities to provide this.

If the controlling device cannot produce the necessary torque, then web spillage will occur and damage to machinery may result.

The controlling device must be large enough to cope with all application torque requirements. Even though most brakes and clutches have both static and dynamic torque capabilities, dynamic torque is more important than static torque in tension applications.

Heat Dissipation

When a clutch, brake, or motor operates in a slipping mode or the motor is generating torque, heat is built up as a result of the mechanical energy being converted to thermal energy. The controlling device must be able to dissipate this (heat) energy. If it doesn't, it will fail, either electrically, mechanically, or both.

The heat dissipation capacity of the controlling device must always exceed the heat produced by the application. Environmental considerations must also be analyzed to insure proper operation. High ambient temperature, enclosures surrounding the controlling device limiting the airflow, or marginal heat dissipation capacity have to be considered.

Some controlling devices may need additional cooling with fans or blowers to increase air flow.

The controlling device must be selected properly to handle the application's heat dissipation. This is probably one of the most critical factors in sizing and selection.

Speed

Brakes, clutches, and motors have minimum and maximum speed ranges. Applications must always be checked to insure that the requirements fall within the capabilities of the controlling device.

Failing to operate the controlling devices within their specifications may result in the application failing to meet the specified requirements; failure of the components mechanically and electrically, or even may result in serious damage or injury.

Selection RPM is used to properly size a unit so that over sizing is minimized and an optimum system can be specified.

Inertia

By definition, inertia is that property of a body that makes it continue in the state of motion or rest in which it may be placed until acted upon by some force.

Inertia is an important factor in tensioning applications because it has an effect in the sizing of the controlling device during acceleration, deceleration, and E-Stop conditions.

Failure to consider inertia during the calculations can definitely result in a system being undersized and unable to provide optimum performance. This may result in instability at start up and overrunning during deceleration and stopping. The end result in all cases will be poor product quality and, usually, excessive scrap.

With the exception of intermediate tension applications and analog control systems, inertias are constantly changing in unwind and rewind applications. Worst-case inertia calculations are normally used for sizing and selecting purposes.

Charts

Charts are provided for all clutches and brakes included in the catalog. They provide a means of selecting the correct controlling device for a given application. Performance charts and product specifications for brakes and clutches start on page 56.

The charts provide thermal vs. selection speed data, the means of selecting the unit based on thermal requirements.

Never select a controlling device whose thermal limits are near or equal to those of the application. The next larger size unit should always be considered or the factory should be consulted for additional options.

Selection charts are also provided for running torque vs. speed and E-Stop torque vs. speed. These charts provide a means of checking the preliminary unit selection based on thermal requirements and torques.

The appropriate charts must be used in the sizing and selection process.

Tension Control Systems

Design Considerations and Selection

Additional Calculations

Additional calculations can be made to determine roll stop time, web payout during stop, and web storage requirements. These become important when using a dancer or load cell control system to ensure optimum performance and to insure the controlling element selected will do the job.

1. Normal Roll Deceleration Stop Time

Normal Roll Decel Stop time =

$$\frac{WR^2 \times \text{Minimum Roll RPM}}{308 \times [\text{Brake Dynamic Torque available} - \text{Maximum Running Torque (Full Roll)}]}$$

2. Roll E-Stop Time

Roll E-Stop Time =

$$\frac{WR^2 \times \text{Minimum Roll RPM}}{308 \times [\text{Brake Dynamic Torque available} - \text{E-Stop Torque Required}]}$$

Determine web payout during normal deceleration stop and E-Stop conditions to determine the amount of web spillage. The calculations that follow may signal a need to upsize the brake or improve the dancer design.

1. Determining Web Payout during normal deceleration

Web Payout during normal deceleration =

$$\frac{\text{Linear Speed (FPM)} \times \text{Roll Stop time (deceleration)}}{120}$$

2. Determining Web Payout during E-Stop

Web Payout during E-Stop =

$$\frac{\text{Linear Speed (FPM)} \times \text{Roll E-Stop time}}{120}$$

3. Machine Web Draw during normal deceleration

Machine Web Draw during deceleration =

$$\frac{\text{Linear Speed (FPM)} \times \text{Machine Decel time}}{120}$$

4. Machine Web Draw during E-Stop

Machine Web Draw during E-Stop =

$$\frac{\text{Linear Speed (FPM)} \times \text{Machine E-Stop time}}{120}$$

Once these values are calculated, web spillage can be determined and the brake selected will be found adequate or its size will have to be increased. Another alternative is dancer design improvements. See dancer design section for calculations and suggestions.

Web Spillage = Web Payout of Roll – Machine Web Draw

This should be calculated for both normal deceleration and E-Stop calculations.

Note: If the numbers calculated are negative, then no payout or spillage will occur.

Often during E-Stop, web spillage will be evident from the above calculations. If this is not a concern and the brake selected can handle the heat dissipation and torque requirements for running and deceleration, the controlling element has been correctly selected.

It may be necessary with E-Stop requirements, to repeat calculations for torque and brake selection until a controlling element can be selected that will match all the parameters.

Selection Conclusions

No matter which type of tension system is selected, unwind, intermediate, or rewind, this is intended as a general sizing selection guide that will probably cover the vast majority of applications. Some instances will surely be encountered where the sizing and selection covered in the previous pages may not apply. In these cases, your local Warner Electric Representative can provide the necessary guidance and assistance to correctly size and select a tension control system.

The sizing and selection process is quite straightforward, although some work is involved. In summary, sizing and selection can be broken down into three simple steps:

1. Selection of the controlling device, i.e., Brake or clutch
2. Controller, Power Supply, etc., i.e., Remote/Analog, Dancer, Load Cell, or Splicer
3. Input Sensing Element, i.e., Dancer Pot, Load Cell, Analog sensor

With the wide variety of tension products available, Warner Electric can offer complete tension packages for almost any application encountered. Because of its vast experience and knowledgeable professionals, Warner Electric can solve your tensioning needs.

Web Storage

A load cell does not provide material storage for machine acceleration. As the machine draws material during the acceleration period, it is pulling against the inertia of the unwind roll. If the roll is large, the acceleration rate is high, and the material is light, the web may break. Therefore, it may be necessary to provide storage in the web path to release material as the roll comes up to speed. Another option would be to use a drive to help bring the roll up to speed. For further information or assistance, please contact your Warner Electric Distributor or Warner Electric Representative.

Note: Constant values in formulas are in bold.

Designing the Optimum Dancer Storage System

For closed loop dancer controlled systems, the actual web tension is determined by the downward pressure of the dancer roll or by the loading on the dancer on the web. Consequently, special attention should go into the design of the dancer arm system to provide both consistent tension and adequate web storage for optimum web stop performance.

Load Cell vs. Dancer

Deciding between a load cell and a dancer system requires consideration of many inter-related factors. Sometimes a load cell control is selected when the material being tensioned is not flexible and will not easily wrap around a dancer roll. For example, medium to heavy gauge metals are often tensioned with load cell systems.

Load cell systems can also be selected because of space limitations in the application, or because they are easier to retrofit to existing applications. In retrofit applications, precision balance or rollers may be required if line speeds are greater than 650 feet per minute.

Dancer tension control is still the preferred method of control in many applications. For example, high speed printing applications may require the “forgiveness” of a dancer system to take-up or release material during the dynamically unstable conditions seen at the unwind or rewind roll. The reasons for unstable conditions include fast decelerations or accelerations, out-of-round rolls, and flying splices. A dancer system should be considered when speeds are high and tension control requires extreme precision.

Dancer Roll Design and Construction

The dancer roll and control arms are the heart of this tension control system. Dancer construction is simple, but very important.

For optimum performance, the dancer should be a thin walled tubing and be loaded by massless, low friction air cylinders. A rolling diaphragm device is most commonly used. For greatest accuracy, the wrap on the dancer roll should be exactly 180 degrees.

Anything attached to the dancer for loading will detract from the dancer's ability to act as a buffer and should be made as light and (in the case of air cylinders) efficient as possible.

Construction of Dancer Arms for Webs

Dancer arms should utilize boxed construction to provide rigidity so that the web does not cause the arms to twist. This also insures that the web will track properly over the dancer roller.

The pivot point should be bearing mounted so the dancer arm can move freely. The dancer roller should also be bearing mounted and the bearings should be small in diameter and as frictionless as possible.

This will help reduce the bearing drag and friction changes which affect good tensioning. Standard feed conveyor rollers and bearings are usually sufficient.

Construction of Dancer Arms for Wire

Wire dancers usually employ a single arm. The pivot point and dancer roller should both be bearing mounted to minimize friction and drag. Standard wire rollers are very good dancer rollers for these type systems. These rollers usually contain excellent integral bearings.

Tension Control Systems

Design Considerations and Selection

Dancer Systems

Dancer Design and Considerations

Warner Electric dancer control systems are designed to control tension in unwind, intermediate, or rewind applications for materials such as paper, foil, films, cloth, metals or wire. The system consists of four parts:

1. The controlling device, i.e. brake, clutch, or drive motor, AC or DC
2. The controller
3. A pivot point sensor which determines the position of the dancer roll
4. The dancer arm and roll assembly (customer supplied)

Dancer Arm Design

Various configurations of dancer arms exist, but their purpose is the same. The dancer provides a means of creating tension on the web by providing a force opposite to the direction the web is pulled.

The effective force applied to the arm to create the desired tension is a function of the number of dancer rollers on the dancer arm.

The more dancer rollers on the dancer arm, the higher the effective force must be to provide the same tension.

Dancer arms should be made of lightweight material to minimize the added effect of weight to the system as well as to keep the inertia as low as possible. Depending on the application and the amount of room available, this will dictate the type of design used and physical size.

The following figures depicting basic dancer designs are intended for guideline only. These are not the only configurations that can be used. Variations on these designs or other designs are acceptable as long as loading and storage requirements can be met.

Figure 1 – Horizontal Dancer with Vertical Movement

Figure 2 – Multiple Roll Dancer with Vertical Movement

Figure 3 – Vertical Dancer with Horizontal Movement

Figure 4 – S-Wrap Dancer with Vertical Movement

Single Roll Dancer

$$F = 2 \times N \times T$$

Where:

F = Effective loading force against the web

T = Tension desired in the web

N = Number of dancer rollers

Multiple Roll Dancers

$$F = 2 \times N \times T$$

Where:

F = Effective loading force against the web

T = Tension desired in the web

N = Number of dancer rollers

Dancer Systems

The following calculations offer a guide for designing a dancer arm. These will provide for an optimum system and for proper loading and storage with the system.

1. Determine Dancer Arm Length, L

This can be done by calculating the length based on the maximum operating linear speed of the system or from the chart below.

a.

Calculating Length

$$L = 12 + \frac{\text{Max Web Speed (FPM)} - 200}{100}$$

Minimum L to maximum L should normally be 12" to 40".

b. Chart Determination

Chart 1 – Dancer Arm Length vs. Web Speed

2. Determine Swing Height of Dancer Arm, S

$$S = 1.04 \times L + D_R$$

Where:

L = Length of arm calculated or chosen in Step 1.

D_R = Diameter of dancer roller

3. Determine Height from edge of web to centerline of Dancer Pivot Point, H

$$H = \frac{S + D_R}{2}$$

Where:

S = Swing height calculated from Step 2.

D_R = Diameter of dancer roller

Because wide ranges of tensions are required from most systems, some type of loading is usually used to make setting the tension easier. The preferred method is to use a pneumatic cylinder [normally a low inertia, friction less type (Bello-fram) cylinder]. Weights or springs can be used, but these add weight and inertia to the system and are sometimes very difficult to stabilize.

4. Selecting the Loading Point, X

$$X_{MIN} = 0.25 \times L$$

$$X_{MAX} = 0.33 \times L$$

Where :

L = Length of the dancer arm

5.* Calculating Cylinder Force Required, F_C

$$F_C = \frac{F \times L}{X}$$

Where:

F = Effective force of the dancer

L = Length of the dancer calculated in Step 1

X = Loading point calculated in Step 4

6. Calculating Cylinder Stroke required

$$\text{Stroke} = 2 \times X \tan 30 \text{ or } 1.155 \times X$$

Where:

X = Loading point from Step 4

By following these guidelines, a dancer design with the +/- 30 degree swing will be achieved. This is the range the Warner Electric pivot point sensors require for optimum control performance.

The following chart depicts the percentage of tension variations based on the dancer position in a properly designed dancer.

Chart 2 - Tension variation vs. dancer arm angle

* See page 135 for effective cylinder force at a given air pressure.

Tension Control Systems

Design Considerations and Selection

The following notes are provided for information purposes and should be considered in the design of a dancer arm. Following these guidelines will result in a more optimized system.

I. Horizontal Dancer with Vertical Movement

A. Downward Loaded Dancer

$$\text{Tension} = \frac{\text{Downward Loading Force}}{2 \times \text{Number of Dancer Rolls}}$$

Total Downward loading force at dancer roll

=

Downward force created by loading +
weight of dancer arm

In this case, the pressure required will be less because the dancer weight adds to the total loading force.

B. Upward Loaded Dancer Arm

$$\text{Tension} = \frac{\text{Upward Loading Force}}{2 \times \text{Number of Dancer Rollers}}$$

Total Upward loading force at dancer roll =

Upward force created by loading -
weight of dancer arm

In this case, the pressure required will be greater because the dancer weight subtracts from the total loading force.

II. Vertical Dancer with Horizontal Movement

Dancer weight in this case is no longer a factor on the loading force on the dancer.

$$\text{Tension} = \frac{\text{Loading Force}}{2 \times \text{Number of Dancer Rollers}}$$

Caution must be used when this type dancer and diaphragm type cylinders as the rod assembly is supported by the cylinder bushing only. Secondary support is necessary to keep the cylinder shaft from binding.

TCS-605-1
TCS-605-2
TCS-605-5

Warner Electric pivot point sensor is a precision electronic positioning device which is used with the MCS-203, MCS-207, TCS-210 or TCS-310 dancer control system to provide smooth control of unwind stands operating at any speed. The sensor is mounted at one end of the dancer roll pivot shaft where it monitors the angular position, direction of travel and relative speed of dancer arm movement. TCS-605-2 used with drive systems.

Dimensions

Specifications

| Model No. | Part No. | Description |
|-------------|--------------|---|
| TCS-605-1 | 7330-448-002 | Single turn potentiometer for dancer arm systems where the range of rotary motion from full-up to full-down dancer position is normally maintained within 60° (1KΩ) |
| TCS-605-2 | 7330-448-004 | Single turn potentiometer for drive systems (5KΩ) |
| TCS-605-5 | 7330-448-003 | Five turn potentiometer for festooned dancer systems (1KΩ) |
| Accessories | | |
| BTCS620 | 7330-448-007 | See manual for drawings |
| | 284-8000-003 | Coupling for Pivot Point Sensors |
| | 7330-101-001 | TCS-605 Cable Assembly Only |
| | 7330-101-002 | TCS-605-1 Sensor Assembly Only |
| | 7330-101-003 | TCS-605-5 Sensor Assembly Only |

Tension Control Systems

Selection Guide

Selecting the Correct Tension Control

Selecting the correct tension control is as important as selecting the proper tension clutch or brake. As the control is the heart of the system which provides the necessary controlling function in the application, selecting the wrong control or inadequate control can be as bad as incorrectly sizing the mechanical portion of the system.

Normally control selection can be very simple if a few simple questions can be answered regarding the application. By doing so, selection can be very easy and painless.

Selection Steps

The following steps outline a simple way of selecting the proper control system for the application.

1. Determine the type of system that is to be used. Will the system be load cell, dancer, or open loop analog control?
2. Next, determine the type of brake or clutch system that the control will be used with. Will this be an electric or pneumatic system?
3. Using the Quick Selection Chart, determine which models may be suitable for the application.

Once the determination of the control/controls has been made for the application, review the specifications for the various controls to determine the characteristics and features that best suit the application and your requirements.

Mechanical Elements

Once the control has been selected, be sure to check that it will work with the brake or clutch previously selected. This can be determined from the specific technical specification for the control selected. Remember, not all controls will work with all clutches and brakes.

If the control selected will not operate the controlling device selected, i.e., clutch or brake, then a different control must be selected.

Control – Quick Selection Guide

| Model Number | Output Voltage | System Type | | | | Air or Electric | Page |
|--------------|------------------------------|---------------|---------------------|-------------|-----------|-----------------|------|
| | | Open Loop | | Closed Loop | | | |
| | | Manual Adjust | Analog Input Adjust | Dancer | Load Cell | | |

Tension Controls

Modular Control Components

BXCTRL

Tension Control

(P/N 6910-448-306)

Tension Controller

The BXCTRL controller is a solid state electronic control that receives signal from a Dancer pivot point sensor or 2 Load cells. It integrates 2 separate Digital PID Controllers and 2 separate Open Loop controls.

All setup can be made through a user friendly application and saved to the integrated memory, an SD card or your computer. Wire up to two Load cells or a Dancer arm to get a closed loop control with a linear or auto. compensation.

When associated with the BX2DRV, the controller becomes the BXCTRL-BX2DRV. Power supply, input and communication will be made by an internal connection.

Specifications

| | |
|--------------------------------------|--|
| Main Supply Voltage | 24VDC +/-5% |
| 2 Channels Sensors Input | Dancer Arm or up to two Load Cells (customer provided) |
| 2 Channels Output | Selectable 0-10V or 4-20mA through an application |
| 2 PID Controller | PID Gain adjustable with the application |
| USB Connection | Connect your BXCTRL to your computer with a USB cable and get access to the application |
| User Friendly Application | Setup all parameters through a user friendly application and get a graphic overview. |
| Parameters Partitions Saving | Through the application save your parameter partitions on your computer or in an SD card. |
| Open Loop Control | Get an open loop control by wiring an external sensor. Selectable 0-10V or 4-20mA |
| Linear and Auto. Compensation | Get a closed loop control with a linear or auto. compensation. Selectable with the application |

BX2DRV

Driver

(P/N 6910-448-305)

BXCTRL-BX2DRV

Driver

(P/N 6910-448-307)

Tension Controller

This double channel driver can accept both voltage (0-10V) or current loop (4-20mA) input signals.

With being associated to a remote potentiometer, it will become an Open Loop Control, permitting then to manually control the braking torque.

Optional Rail DIN fixation available.

For use with TB, ATT and MPB or MPC unit.
POB, PRB-H, PTB, PMC, PHC or POC.
Sizes 10 or smaller.

Tension Control/Driver

Combines control and driver characteristics of BXCTRL and BX2DRV with a 24 volt driver in a single housing.

Specifications

| | |
|--|---|
| Main Supply Voltage | 24V DC +/-5% |
| 2 Channels 4A Output | 0-24V or 0-4A Selectable with Anti residual |
| 2 Analog Input | 0-10V or 4-20mA Selectable |
| Easy to set up | ON and OFF Mode Inputs |
| 2 Auxiliary Inputs with a Calibration Feature | Get an open loop control with a roll diameter compensation Sensor Input 0-10V or 4-20mA Selectable |

Tension Controls

Modular Control Components

DRV2

Driver Control

(P/N 6910-448-109)

Tension Controller

Dual Channel/Dual Voltage Driver for 24 VDC or 48 VDC Operation. For use with MTB brakes or POB, PRB-H, PTB, PMC, PHC or POC. Size 20 or smaller.

Specifications

| | |
|--|---|
| Input Voltage | 24 Volts DC or 48 Volts DC, + / - 10% |
| Output Voltage | 24 VDC or 48 VDC depending on power supply input voltage. In Overvoltage mode, output voltage is limited to 48 volts DC for 30 seconds before reducing to 24 VDC. |
| Output Current | Maximum of 4.5 amps DC per channel. Overload capacity to 6 amps maximum per channel for 30 seconds, to be followed by maximum 3 amps for a period of minimum 120 seconds. |
| Anti-Residual Output | 10% of input power supply voltage. Adjustable for each channel. -2.4 volts DC with 24 VDC power supply input -4.8 volts DC with 48 VDC power supply input |
| Analog Input Voltage: | 0 to 10 Volts DC on Input A or Input B. When operating with 48 volt DC power, input of 0 to 5 volts corresponds to 24 Volt DC output, and from 5 to 10 volts input overvoltage mode from 24 to 48 volts DC with timed limitation |
| Status and Diagnostic Indicators: | 2 LED's on each channel indicate normal operation and fault conditions during operation. One Green and one Red LED. |
| Input | Polarity protected to prevent damage in the event of inversion of DC power supply voltages. |
| Output | Short circuit protected during operation and power up. Output is also protected from overload conditions. Once short circuit is detected, drive locks out for 10 msec and resets. After 4 cycles, drive trips out and requires reset. |
| Reset Mode | Requires power off and then power on to reset driver. |
| Wiring | Via 10 position pluggable terminal block. |

XPRO

Tension Control System

(P/N 6910-448-308)

Tension Control System

The XPRO human interface is an optional component to the Warner Electric BXCTRL control which is providing to the user an easy way to get access to the PID regulation SetPoint.

It is generally used with load cells application when the current Tension needs to be changed when running.

It's offering some display screens which could be setup to show some curves or some other data as the current tension, the real time output voltage.

Electro-Pneumatic Transducer

(P/N 6910-101-066)

Used for interfacing with pneumatic brakes. Warner Electric offers a convenient package that consists of an air filter with automatic moisture drain, together with one I/P (current-pressure) transducer.

Specifications

| | |
|--------------------------------|--|
| Input signal | 4–20mA |
| Output range | 0–120 Psig. |
| Supply pressure | 20–150 Psig. Note: Supply pressure to the transducer must always be at least 5 Psig. above the maximum output pressure required for the brake. |
| Temperature range | -20°F to 150°F |
| Minimum air consumption | 6.0 (SCFH) at 15 Psig. |
| Supply pressure effect | 1.5 Psig. for 25 Psig. supply change |
| Pipe size | 1/4" NPT (transducer and filter) |

Analog/Manual Control for Electric Brake Systems

TCS-200-1

(P/N 6910-448-086)

TCS-200-1H

(P/N 6910-448-087)

TCS-200

(P/N 6910-448-126)

TCS-200-1-C

(P/N 6910-448-089)
(not shown)

Analog/Manual Control

The Analog/Manual Control is a basic, low cost, open loop control for manual type operation of Electro Disc tension brakes. A remote torque control function is available that enables the operator to control the desired tension from any convenient location. A roll follower feature provides automatic adjustment of brake torque proportional to roll diameter change. For the TCS-200-1 and TCS-200-1H analog inputs can be followed.

Typical System Configuration

The complete system consists of:

1. Tension brake
2. Analog tension control
3. Control power supply
4. Optional sensor inputs (customer supplied)

The control unit maintains a current output to the tension brake based on an analog input or the manual setting of the control tension adjustment dials. Varying the current from the control creates more or less brake torque for tension adjustability.

Specifications

Input

TCS-200 24–30 VAC, $\pm 10\%$, 56/60 Hz, single phase
TCS-200-1, TCS-200-1H 115/230 VAC, $\pm 10\%$, 50/60 Hz, single phase

Output

TCS-200 PWM full wave rectified, 0–3.24 amps current controlled
TCS-200-1 Adjustable 0–24 VDC, 4.25 amps maximum continuous
TCS-200-1H Adjustable 0–24 VDC
 Maximum of 5.8 amps continuous
 Can be used with any 24 VDC tension brake. TCS-200 requires sense coil for operation. Sense Coil – 275-3893
 TCS-200-1 and TCS-200-1H can be used with or without sense coil.

Ambient Temperature

TCS-200 -20° to $+115^{\circ}$ F (-29° to $+46^{\circ}$ C)
TCS-200-1, TCS-200-1H -20° to $+125^{\circ}$ F (-29° to $+51^{\circ}$ C)

Sensor Inputs

Remote Torque Adjust

TCS-200, TCS-200-1, TCS-200-1H 1000 ohms

Roll Follower

TCS-200 10K ohms
TCS-200-1, TCS-200-1H 1000 ohms

Analog Voltage Input

TCS-200-1, TCS-200-1H 0–10 VDC (optically isolated when used with an external 15–35 VDC supply)

Analog Current Input

TCS-200-1, TCS-200-1H 4–20 mA (optically isolated when used with an external 15–35 VDC supply)

Auxiliary Inputs

Brake Off (all models)

Removes output current to the brakes. Puts the brake at zero current.

Brake On (all models)

Applies full voltage to the connected brake.

Front Panel Adjust

Tension Adjust (all models)

Provides current adjust to the brake from 0–100%.

In the remote mode, provides for maximum output level set to the brake.

Brake Mode Switch (all models)

Allows for full brake on, run, or brake off modes of operation to the brake.

Indicators (all models)

Green LED power indicator showing AC power is applied to the control.

Red LED short circuit indicator showing shorted output condition. Resettable by going to brake off mode with front panel switch.

General (all models)

The control chassis must be considered NEMA 1 and should be kept clear of areas where foreign material, dust, grease, or oil might affect control operation.

Note: When used with other than MTB magnets, inductive load must be supplied – PN 275-3843. Consult factory for details.

Analog Control for Electric Brake Systems

MCS-204

(P/N 6910-448-017)

(Shown with Housing)

Remote/Analog control

The MCS-204 control, also completely solid state, is designed for manual or analog input control. The MCS-204 can control two 24 VDC tension brakes in parallel. It also has an antiresidual (magnetism) circuit, a brake on and a highly accessible terminal strip for rapid connection. It is designed for use with the MCS-166 power supply.

MCS-166 Power Supply (page 53).

Specifications

| | |
|-----------------------------|--|
| Input | 24-28 VDC @ 3 Amps (from MCS-166, 1.5 amps for single MCS-166; 3.0 amps from dual MCS-166's) or other power source. |
| Output | Pulse with modulated 0-24 VDC for 24 volt Warner Electric tension brakes. |
| Ambient Temperature | -20° to +113°F (-29° to +45°C). |
| External Inputs | |
| Torque Adjust | Controls tension by applying the desired amount of current to the brake. |
| Brake On | Applies full current to tension brake. |
| Brake Off | Removes brake current and applies antiresidual voltage to eliminate brake drag. Useful when changing rolls. |
| Operating Modes | |
| Local Torque Adjust | Knob on front panel. |
| Remote Torque Adjust | Via remote potentiometer. |
| Roll Follower | Using external potentiometer. |
| Current Loop | 1-5 mA, 4-20 mA, 10-50 mA. Voltage Input: 0-14.5 VDC. |
| Mounting | |
| | Available for panel mounting with exposed wiring or wall/shelf mounting with conduit entrance. Must be ordered with either wall/shelf or panel enclosures. |

Requires enclosure, see page 54.

Typical System Configuration

The complete system consists of:

1. Tension brake
2. Analog tension control
3. Control power supply
4. Analog signal input (customer supplied)

The control unit maintains a current output to

the tension brake based on an analog input or the manual setting of the control tension adjustment dials. Varying the current from the control creates more or less brake torque for tension adjustability.

Tension Controls

Analog Control for Electric Brake Systems

TCS-220

(P/N 6910-448-027)

(Shown with Housing)

The remote analog input control is an open loop system designed to allow easy interface with existing or specially designed customer controls to complete a closed loop system. The system also offers complete operator controllability for manual tensioning control.

TCS-167 Power Supply, (page 53).

Note: When used with other than MTB magnets, a resistor, 68 ohms, 25 watts, must be added. Consult factory for details.

Specifications

Input

TCS-220 – 48 VDC @ 1.6 Amps continuous, 48 VDC @ 6 Amps intermittent, 1.6% duty cycle, 30 sec. on time, 8–12 VDC @ 1.5 Amps.

TCS-167 – 120 VAC, 50/60 Hz or 240 VAC, 50/60 Hz (Switch selectable).

Output

TCS-220/TCS-167 – 0–270 mA/magnet (running); 270–500 mA/magnet (stopping).

Ambient Temperature

–20° to +113°F (–29° to +45°C).

External Inputs

Torque Adjust

Controls tension by applying the desired amount of current to the brake.

Emergency Stop

Applies full current to tension brake.

Brake Off

Removes brake current and applies antiresidual current to eliminate brake drag. Useful when changing rolls.

Operating Modes

Local Torque Adjust

Knob on front panel.

Remote Torque Adjust

Via 1K to 10K ohm potentiometer.

Roll Follower

Via 1k to 10k ohm potentiometer.

Current Loop

1–5 mA, 4–20 mA, 10–50 mA current source.

Voltage Input

0–14.5 VDC.

Adjustments

Torque Adjust/Span

Controls output manually in local torque mode. Sets maximum control span in remote torque adjust, roll follower, current loop; or voltage input mode.

Zero adjust

Potentiometer adjustment for setting zero output level. Front panel access.

Brake off input

Terminal strip connection which provides for removal of brake current and applies antiresidual current to eliminate brake drag. Used primarily when changing rolls.

Brake on input

Terminal strip connection applies full current to brake when activated regardless of input control signal. Used for emergency stops.

Mounting

TCS-220 – available as panel mounted with exposed wiring, or wall/shelf mounted with conduit entrance.

TCS-167 – Available with open frame or wall/shelf mounted enclosure with conduit

Requires enclosure, see page 54.

Typical System Configuration

The complete system consists of:

1. Tension brake
2. Analog tension control
3. Control power supply
4. Analog signal input (customer supplied)

The control unit maintains a current output to

the tension brake based on an analog input or the manual setting of the control tension adjustment dials. Varying the current from the control creates more or less brake torque for tension adjustability.

Dancer Control for Electric Brake Systems

MCS-203

(P/N 6910-448-014)

(Shown with Housing)

The completely solid state MCS-203 Dancer Control Module is designed for automatic web tensioning through the use of a dancer roll. The MCS-203 can control two 24 VDC tension brakes in parallel. It works on the concept of a P-I-D controller and has internal P, I & D adjustments for optimum performance regardless of brake size.

MCS-166 Power Supply, (page 53).

Specifications

| | |
|-----------------------------|--|
| Input | 24–28 VDC @ 3 Amps (from MCS-166, 1.5 amps for single MCS-166; 3.0 amps from dual MCS-166's) or other power source. |
| Output | Pulse width modulated 0–24 VDC for 24 volt Warner Electric tension brakes. |
| Ambient Temperature | –20° to +113°F (–29° to +45°C). |
| External Inputs | |
| Dancer Potentiometer | Provides the feedback signal of dancer position and movement for input to the control. |
| Brake On | Applies full current to tension brake. |
| Brake Off | Removes brake current and applies antiresidual current to eliminate brake drag. Useful when changing rolls. |
| Antidrift Input | Nullifies integrator portion of control for faster brake response. Important for splicing and mid-roll starting. |
| Mounting | Available for panel mounting with exposed wiring or wall/shelf mounting with conduit entrance. Must be ordered with either wall/shelf or panel enclosures. |

Requires enclosure, see page 54.

Typical System Configuration

The complete system consists of:

1. Tension brake
2. Dancer tension control
3. Control power supply
4. Pivot point sensor
5. Dancer roll assembly (customer supplied)

The control unit maintains a current output to the tension brake based on an analog input or the manual setting of the control tension adjustment dials. Varying the current from the control creates more or less brake torque for tension adjustability.

Tension Controls

Dancer Control for Electric Brake Systems

TCS-210

(P/N 6910-448-026)

(Shown with Housing)

This closed loop tension control system automatically controls tension on unwinding materials such as paper, film, foil, cloth and wire.

TCS-167 Power Supply, (page 53).

Note: When used with other than MTB magnets, a 68 ohm, 25 watt resistor must be added. Consult factory for details.

Specifications

Input

TCS-210 – 48 VDC @ 1.6 Amps continuous, 48 VDC @ 6 Amps intermittent, 1.6% duty cycle, 30 sec. on time, 8–12 VDC @ 1.5 Amps.

TCS-167 – 120 VAC, 50/60 Hz or 240 VAC, 50/60 Hz (Switch selectable).

Output

TCS-210/TCS-167 – 0–270 mA/magnet (running); 270–500 mA magnet (stopping).

Ambient Temperature

–20° to +113°F (–29° to +45°C).

External Inputs

Dancer Potentiometer

Provides the feedback signal of dancer position and movement for input to the control.

Brake On

Applies holding brake voltage.

Anti-Drift Input

Nullifies integrator portion of control for faster brake response. Important at startup and for mid-roll starts.

Brake Off

Removes brake current and applies antiresidual current to eliminate brake drag. Useful when changing rolls.

Mounting

TCS-210 – available as panel mounted with exposed wiring, or wall/shelf mounted with conduit entrance.

TCS-167 – available with open frame or wall/shelf mounted enclosure with conduit entrance.

Requires enclosure, see page 54.

Typical System Configuration

The complete system consists of five components:

1. Tension brake
2. Dancer tension control
3. Control power supply
4. Pivot point sensor
5. Dancer roll assembly (customer supplied)

The weight of the dancer roll or loading on the dancer determines the tension on the web and the remainder of the system operates to hold the dancer roll as steady as possible. When the dancer position changes, the Warner Electric pivot point sensor tracks the direction and speed of the change and sends an electric signal to the closed loop control, which, in turn, relays a corrective signal to the Electro Disc tension brake. Increasing current to the Electro Disc increases braking

torque to elevate the dancer to the desired position, while reducing brake current lowers the dancer.

The closed loop dancer control system is completely automatic, limiting the need for operator involvement and the potential for inaccurate tension control. The system offers exceedingly rapid response that, in effect, corrects tension errors before they reach the work area of the processing machine.

Dancer Control for Pneumatic Brake Systems

MCS-207

(P/N 6910-448-066)

(Shown with Housing)

The dancer control, MCS-207 is designed for automatic web tensioning through the use of a dancer roll. The MCS-207 can control either a voltage to pneumatic or current to pneumatic transducer with an air operated clutch or brake. It works on the concept of a P-I-D controller and has internal adjustments of the P-I-D loops for optimum performance regardless of the brake size.

MCS-166 Power Supply, (page 53).

Note: When used with other than MTB magnets, a 68 ohm, 25 watt resistor must be added. Consult factory for details.

Specifications

| | |
|----------------------------|--|
| Input | 24–28 VDC, 0.5 amps maximum (from MCS-166 or other power source) |
| Output | Switch selectable current or voltage Voltage: 0–10 VDC Current: 1–5 mA, 4–20mA, 10–50mA Will operate most electric to pneumatic transducers available. |
| Ambient Temperature | +32° to +120°F (0° to +49°C). |
| Control Input | Pivot point sensor, MCS-605-1 or TCS-605-5 |
| External Inputs | |
| Brake On | Applies maximum output signal (voltage or current) to the transducer |
| Brake Off | Removes output from the transducer and applies minimum level |
| Anti-Drift | Provides integrator reset function for mid-roll starting |
| Adjustments | |
| Front Panel | Dancer Position: sets dancer operating position Gain: Controls overall system response based on change of dancer input signal |
| Mounting | Available as panel mounted with exposed wiring, or wall/shelf mounted with conduit entrance. Note: Must be ordered with wall/shelf enclosure or with panel mount enclosure. |

Requires enclosure, see page 54.

Typical System Configuration

The complete system consists of:

1. Pneumatic tension brake
2. Dancer tension control
3. Control power supply
4. Pivot point sensor
5. E to P transducer
6. Dancer roll assembly (customer supplied)

The control unit maintains an output to the tension brake based on an analog input or the manual setting of the control tension adjustment dials. Varying the signal from the control creates more or less brake torque for tension adjustability.

Tension Controls

Dancer Splicer Control for Electric Brake Systems

TCS-310

(P/N 6910-448-042)

This closed loop tension control system automatically controls tension on unwinding materials such as paper, film, foil, cloth and wire.

TCS-168 Power Supply, (page 53).

Note: When used with other than MTB magnets, a 68 ohm, 25 watt resistor must be added. Consult factory for details.

Specifications

Input

TCS-310 – 48 VDC @ 3.2 Amps continuous, 48 VDC @ 12 Amps intermittent, 1.6% duty cycle, 30 sec. on time, 8–12 VDC @ 3.0 Amps.

TCS-168 – 120 VAC, 50/60 Hz or 240 VAC, 50/60 Hz (Switch selectable).

Output

TCS-310/TCS-168 – 0–270 mA/magnet (running); 270–500 mA/magnet (stopping) on controlled output channel 0 to 90 mA holding channel.

Ambient Temperature

–20° to +113°F (–29° to +45°C).

External Inputs

Dancer Potentiometer

Provides the feedback signal of dancer position and movement for input to the control.

Brake On

Applies holding brake voltage.

Anti-Drift Input

Nullifies integrator portion of control for faster brake response. Important for start-ups.

Brake Off

Removes brake current and applies antiresidual current to eliminate brake drag. Useful when changing rolls.

Mounting

TCS-310 – available as NEMA 4 enclosure with remote control station.

TCS-168 – available with open frame or wall/shelf mounted enclosure with conduit entrance.

Typical System Configuration

The complete system consists of five components:

1. Two tension brakes
2. Dancer splicer control
3. Control power supply
4. Pivot point sensor
5. Dancer roll assembly (customer supplied)

The weight of the dancer roll or loading on the dancer determines the tension on the web and the remainder of the system operates to hold the dancer roll as steady as possible. When the dancer position changes, the Warner Electric pivot point sensor tracks the direction and speed of the change and sends an electric signal to the closed loop control, which, in turn, relays a corrective signal to the Electro Disc tension brake. Increasing current to the Electro Disc increases braking torque to ele-

vate the dancer to the desired position, while reducing brake current lowers the dancer.

The closed loop dancer control system is completely automatic, limiting the need for operator involvement and the potential for inaccurate tension control. The system offers exceedingly rapid response that, in effect, corrects tension errors before they reach the work area of the processing machine.

MCS-166

(P/N 6910-448-013)

(Shown with Housing)

Power Supply for MCS-203, MCS-204, MCS-207, and MCS-208 Controls

Warner Electric's MCS-166 is the companion power supply module to be used with MCS-203 and MCS-204 tension controls. The MCS-166 supplies the 24–28 VDC that these systems require. The MCS-166 is a modular unit designed to couple with its respective control or it can be mounted separately. It is also fused for overload protection, has a voltage indicator light, and is internally protected against 240 VAC input when set for 120 VAC.

Specifications

Input

120 VAC 50/60 Hz or 240 VAC 50/60 Hz (switch selectable).

Output

24–28 VDC (1.5 Amps).

Note: For dual brake application, two MCS-166's are required, 3.0 amps output.

Ambient Temperature

-20° to +113°F (-29° to +45°C).

Mounting

Available for panel mounting with exposed wiring or wall/shelf mounting with conduit entrance. Must be ordered with either wall/shelf or panel enclosures.

Requires enclosure, see page 54.

Magnet Selector Static Switch

The magnet selector switch allows magnets to be dynamically or statically added or removed from the tension system to be tailored to the application need. Examples include shedding magnets for narrow, light webs near core or adding magnets for emergency stops.

TCS-167

(P/N 6910-448-025)

The TCS-167 power supply is designed to provide the correct power input to MCS-207, TCS-210, and TCS-220 tension controls. Its switch selectable input allows the user to adapt to 120 or 240 VAC. It has dual voltage circuits to provide low voltage power and anti-residual output as well as power to operate a brake. The TCS-167 is available with an open frame for control panel mounting.

Specifications

Input

120 VAC or 220/240 VAC, ± 10%, 50/60 Hz, 1 phase. (switch selectable)

Output

Unregulated 9-12 VDC @ 1.5 Amps
Unregulated 48 VDC @ 1.6 Amps continuous, 48 VDC @ 6 Amps intermittent, 1.6% duty cycle, 30 seconds on time.

Ambient Temperature

-20°F. to +113°F. (-29°C. to +45°C.)

Mounting

Open frame wall/shelf mount with conduit entrance

TCS-168

(P/N 6910-448-032)

The TCS-168 power supply is designed to provide the correct power input to the TCS-310 Dancer Splicer Control and the TCS-320 Analog Splicer Control. Its switch selectable input allows the user to adapt to 120 or 240 VAC. It has dual voltage circuits to provide low voltage power and anti-residual output as well as power to operate two brakes. The TCS-168 is available with an open frame for control panel mounting.

Specifications

Input

120 VAC or 220/240 VAC, ± 10%, 50/60 Hz, 1 phase. (switch selectable)

Output

Unregulated 9-12 VDC @ 3 Amps
Unregulated 48 VDC @ 3.2 Amps continuous, 48 VDC @ 6 Amps intermittent, 1.6% duty cycle, 30 seconds on time.

Ambient Temperature

-20°F. to +113°F. (-29°C. to +45°C.)

Mounting

Open frame wall/shelf mount with conduit entrance

Each selector switch provides two circuits, each capable of switching up to four magnets.

How to Order

To order, specify Magnet Selector Static Switch 6910-101-007.

Tension Controls

Dimensions/Enclosures

Dimensions

TCS-200-1

Wall/Shelf Mount

Tension Controls – For use with MCS-203, MCS-204 or MCS-207 order part number 6910-448-016.

For use with TCS-210 or 220, order part number 6910-448-029.

Power Supplies – For use with MCS-166, order part number 6910-448-019.

Panel Mount

Tension Controls – For use with MCS-203, MCS-204 or MCS-207 order part number 6910-448-015.

For use with TCS-210 or 220, order part number 6910-448-028.

Power Supplies – For use with MCS-166, order part number 6910-448-018.

Ribbon Cable

A ribbon cable has been added to the rear terminal board of the MCS-203/204/207 and MCS-166 enclosures to improve performance and reliability. The upgrade is fully retrofitable and enclosure part numbers have not changed.

Dual Brake Controls

TCS-310

Power Supplies

TCS-167, TCS-168

(P/N 6910-448-033)

Tension Controls

Selection Guide

Selection Guide

Selecting the proper clutch or brake starts with collecting the appropriate data. See the data form on page 13. Once the data is collected, go through the various calculations for thermal and torque requirements. Examples are on pages 16-28. At this point, a general selection can be made from these two pages. Then go to the applicable page for further details on the unit such as mounting considerations and dimensions.

Finally, a control system must be chosen – several factors will influence this choice, such as degree of accuracy required (open vs. closed loop), physical restraints in the machine (dancer or load cell). Go to the controls section on page 38 for full specifications and details on these various controls systems.

Once control system is selected, determination of dancer, load cell, or analog system can be made. Dancer design considerations can be found on pages 32-36.

You are now well on the way to specifying the best tension control system available.

| | Product | Description and most suitable applications |
|----------|--|---|
| Electric | TB Series  Brakes | Basic Tension Brakes Single disc friction electromagnetic brake. Operates with any Warner 24V or 90V control. Very economical. Excellent life when properly sized. |
| | ATT Series  Brakes & Clutches | Advanced Technology Brakes & Clutches The tension version of the popular Warner Electric Advanced Technology clutches and brakes. Economical and easy to install. The clutch has an easily adaptable pulley mounting. Operated by full family of Warner Electric tension controls, 24V and 90V. |
| | MTB Series  Brakes | Modular Tension Brakes Single or double disc electromagnetic brake uses multiple pucks for precise selection of torque range. Unique design provides up to double normal operating torque for E-stops. Works with all Warner Electric 24V tension controls. |
| | M Series  Brakes & Clutches | Permanent Magnet Brakes & Clutches These units can be used as either clutch or brakes. They operate with permanent magnets, thereby requiring no external power source. Very accurate torque control is manually adjustable. |
| | Magnetic Particle  Brakes & Clutches | Magnetic Particle Brakes & Clutches Very precise torque control in an enclosed unit that does not have friction discs, but employs magnetically charged powder that varies torque according to current. Works with all Warner Electric 24V tension controls. |

Heat Transfer Capacity

| Dynamic Torque Rating | Continuous Operation | On-Off Operation | Typical Applications and Comments | Page No. |
|--|----------------------|------------------|--|----------|
| 0.50–256 lb.ft. | .02–1.1 HP | .03–2.12 HP | Narrow to medium width web machines such as business forms presses. Also good on wire pay-offs. A low-cost alternative in many applications. | 60 |
| 7–62 lb.ft. Up to 83 lb.ft. with overcurrent | .3 to .9 HP | — | Light tension on narrow web paper or plastic film, such as bag making machines and printing presses. Clutch provides a good, economical solution on many winders. | 66 |
| 0.21–592 lb.ft. Up to 1,120 lb.ft. with overcurrent | .25–2.75 HP | — | The work horse of the brake line. Wide dynamic torque range. Good for business forms presses, wire pay-offs, slitters, coaters. Excellent choice for closed loop as well as open loop systems. | 74 |
| 0–65 lb.in. | 3-150 watts | — | Excellent problem solver for difficult light tension applications. Particularly good for nip-roll control where diameter compensation is not required. Perfect solution for wire braiders and twisters where pay-off is spinning. No control required. | 86 |
| .17–578 lb.ft. | 10-400 watts | — | Excellent solution where wear particles of friction disc units cause a problem. Very precise torque regulation. Will operate with great accuracy at lower speeds than friction disc units. Staying within thermal capacity is critical for long life. | 94 |

Tension Brakes and Clutches

Selection Guide

| | Product | Description and most suitable applications |
|-----------|---|--|
| Pneumatic | Mistral  Brakes | Pneumatic Brakes The Mistral combines high thermal capacity with a rugged, easy-to-maintain design. No guard is required. Both open and closed loop controls available. Optional cooling fan increases heat dissipation. |
| | MODEVO  Brakes | Pneumatic Brakes Combination of high thermal capacity and broad range of torques through various selection of actuators and friction pads. Option for increase thermal capacities. |

Heat Transfer Capacity (Continued)

| Dynamic Torque Rating | Continuous Operation | On-Off Operation | Typical Applications and Comments | Page No. |
|-----------------------|--|------------------|--|----------|
| 5.2–1,328 lb.ft. | 3.2–6.4 HP | 3.5–7.0 HP | The brake of choice in the corrugator industry due to long life and ease of maintenance. Other converting industry applications apply equally. | 118 |
| 0.6–3,180 lb.ft. | 1–17 HP 4–18 HP with optional blower | — | Compatibilities of various actuator and friction pad combinations allow for wide range of applications. | 122 |

Electric Brakes

TB Series – Basic Tension Brakes

System Features

- Full roll to core control
- Consistent tension, even during flying splices, rapid starts and emergency stops
- Eliminates web flutter to allow better registration control
- Electronic System responds in milliseconds
- Dramatically reduces material waste, downtime and maintenance
- Total systems capability—worldwide distribution—local professional service.

Features – Basic Tension Brakes

- Ideal for light duty, light load unwind tension applications
- Cost effective
- Compact package size
- Eight models
- Small sizes, from 1.7” dia. to 15.25” dia.
- .025 to 1.09 thermal horsepower capacity

Complete Control Capability

Warner Electric offers two functionally different controls and a companion power supply for all models of TB Series 24 VDC tension brakes. All three units offer compact dimensions and modular design for easy, low cost maintenance. Both controls (MCS-203/MCS-204) and the power supply are furnished with either a panel mount or wall/shelf mount enclosure at no added cost. Controls information starts on page 38.

MCS-203
Dancer Control

| TB-825 | 0.27 HP | 0.48 HP | 3000 | 0.360 | 43.200 | 1.18 | 20 | 28 |
| TB-1000 | 0.48 HP | 0.88 HP | 2400 | 0.790 | 88.000 | 1.22 | 20 | 29 |
| TB-1225 | 0.70 HP | 1.27 HP | 2000 | 1.430 | 172.000 | 1.08 | 22 | 26 |
| TB-1525 | 1.09 HP | 2.12 HP | 1600 | 2.130 | 256.000 | 1.21 | 20 | 29 |

Notes

1. Alternate duty operation is defined as 30 minutes run-time with 30 minutes off-time
2. Minimum torque is with Warner Electric tension control providing anti-residual current to brake in off state. Minimum torques will be higher when controls without anti-residual current are used.
3. Dynamic torques are based on 30 RPM slip speed

* See page 137 for specific shaft sizes and bushing numbers.

These units, when used with the correct Warner Electric conduit box, meet the standards of UL-508 and are listed under the guide card #NMTR, file #59164 and are CSA Certified under file #LR11543.

Electric Brakes and Clutches

ATT Series – Advanced Technology Brakes and Clutches

Advanced Technology – A new design concept!

Warner Electric's ATT Series clutches and brakes are rugged and durable.

Besides providing the ultimate in long life and durability, the ATT units are easily repairable... and, for the first time, mounting a standard sheave, pulley or sprocket to the clutch is a snap.

AT Clutches and Brakes are completely assembled at the factory and have been specifically designed to match the torque ratings of standard motors, reducers, and other power transmission components. Easy to select and easy to install.

Features:

ATT Tension Clutches and Brakes

- Ideal for intermediate range applications
- Both brake and clutch models for winders and unwinders
- .284 to .9 thermal horsepower capacity
- Brake wear faces replaceable on the shaft for limited downtime
- Full range of control options. See pages 38-39.

| Unit Size | Maximum RPM | Continuous ¹ Dynamic Torque | Overcurrent E-Stop Torque |
|---------------------|-------------|--|---------------------------|
| ATT Brakes | | | |
| ATTB-25 | 3600 | 8 lb.ft. | 15 lb.ft |
| ATTB-55 | 3600 | 15 lb.ft. | 21 lb.ft. |
| ATTB-115 | 3600 | 62 lb.ft. | 83 lb.ft. |
| ATT Clutches | | | |
| ATTC-25 | 3600 | 7 lb.ft. | *2 |
| ATTC-55 | 3600 | 12 lb.ft. | * |
| ATTC-115 | 3600 | 41 lb.ft. | * |

Notes

1. Dynamic torque is constant over a speed range of 0–600 RPM
2. Overcurrent is not used on clutch applications for tensioning

Continuous Operation

Thermal HP vs. Selection RPM

Electric Brakes and Clutches

ATT Series – Advanced Technology Brakes and Clutches

Special Coil Designs

High temperature coil wire improves durability in the face of high temperature environments and high cycle rates or high inertia cycling that generate large amounts of heat. High temperature Teflon leads are very resistant to accidental abrasion and cutting.

Replaceable Friction Discs

Friction disc is designed as separate assembly from clutch rotor or brake magnet, allowing for replacement of the wear surface without the expense of replacing other valuable unit components. Provides superior wear life with reduced engagement noise level.

Advanced Technology Tension Clutches and Brakes

- Ideal for intermediate range applications
- Both brake and clutch models for winders and unwinders
- .284 to .9 thermal horsepower capacity
- Wear faces replaceable on the shaft for limited downtime
- Full range of control options

Complete Control Capability

Optional Accessories

Warner Electric offers a number of optional accessories as well as rebuild kits, which may make an ATT clutch

or brake easier to apply to your machine. See pages 38-39 for controls.

Electric Brakes and Clutches

ATT Series – Advanced Technology Brakes and Clutches

ATTC Clutch

Rugged spline drive for maximum durability.

Sealed, high-temperature coil with tough Teflon lead wires for easy power connection.
UL recognized.

Long life, quiet operations. Friction disc replaceable without disassembly of unit in most applications.

Easily visible friction disc indicates when replacement is necessary.

Easy sheave mounting. Optional sheaves and pulleys available from Warner Electric. Many other industry-standard sheaves and pulleys adaptable through simple boring and key seating.

Sealed heavy-duty bearings with high-temperature lubricant maintain tight concentricities and running efficiency.

Rugged steel wear surface and precision cast iron components. Superior wear life, torque capacity and magnetic characteristics.

Electric Brakes

MTB Series – Modular Tension Brakes

One of the keys to the Warner Electric tensioning system is the Electro Disc tension brake. Electro Disc brake systems are capable of continuous slip from full roll to core diameter while providing outstandingly consistent and accurate control of unwind tension throughout the process. Electro Disc brakes operate smoothly and quietly. They respond instantly for emergency stops. Wear life is remarkable. Electronic control systems are easily interfaced with Warner Electric controls. Selection of the right brake for virtually any web processing application, from film to boxboard, is made possible through a building-block modular design.

Simple Maintenance

Rugged design eliminates most moving parts. No diaphragms to break down. Asbestos-free brake pads are quickly and easily replaced. Brake wear does not affect torque as with some other types of brakes.

Easy Installation

Electro Disc tension brakes fit within tight space restrictions. Bushings adapt to most standard and metric shafts. Electrical installation replaces complex pneumatic plumbing, valves and compressors.

Long Life, High Heat Dissipation

A replaceable face armature disc provides extremely long life and maximum heat dissipation. Standard armature discs can be mounted singly or in tandem as shown here to increase the heat dissipation and torque capability.

Accurate, Consistent Control

The responsiveness of electric brakes coupled with specially designed controls provides accurate tensioning from beginning to end of roll, even during emergency stops and flying splices.

Brake Modularity

With one to sixteen magnets and single or double armature discs, Electro Disc tension brakes offer torque control and continuous slip capacity to meet a broad spectrum of requirements for virtually any web processing application.

Four armature sizes

Design

The Electro Disc design is a proven concept, featuring a simple, yet powerful tension brake ... easy-to-control, smooth, quiet and accurate. The speed of response and controllability, especially near zero tension, far exceeds that of other braking technologies.

Simple. Powerful. Controllable.

The electromagnetic principle, as applied to the Electro Disc tension brake, results in a brake design that features outstanding control from zero torque to the maximum limits of the brake. Complex moving parts are eliminated.

Smooth Operation with Minimal Maintenance

The friction pads are made of a unique composite of asbestos-free friction materials specially designed to produce smooth, powerful, yet quiet engagement between the magnet and armature discs. Since the replaceable friction pads and armature disc are the only parts which receive regular wear, the electromagnets can be reused indefinitely. An indicator notch on the friction pad, as well as an optional electric wear indicator, makes routine checking for remaining wear life quick and easy.

MTB-II ... the second generation

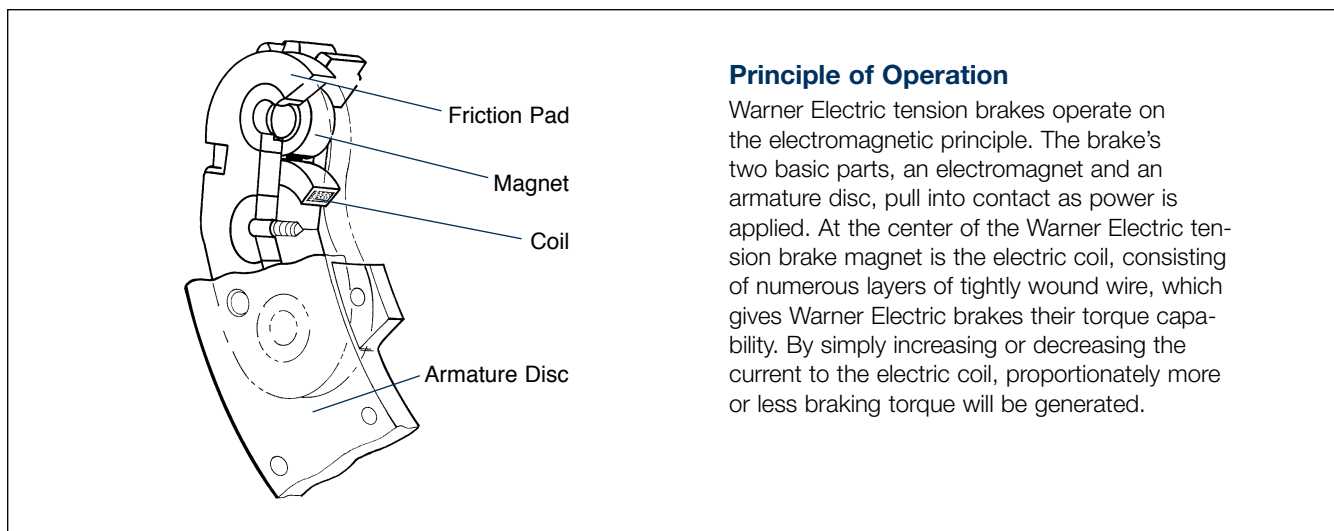

Single disc, 2 magnets

Dual disc, 12 magnets

Electric Brakes

MTB Series – Modular Tension Brakes

Principle of Operation

Warner Electric tension brakes operate on the electromagnetic principle. The brake's two basic parts, an electromagnet and an armature disc, pull into contact as power is applied. At the center of the Warner Electric tension brake magnet is the electric coil, consisting of numerous layers of tightly wound wire, which gives Warner Electric brakes their torque capability. By simply increasing or decreasing the current to the electric coil, proportionately more or less braking torque will be generated.

MTB-II...The Second Generation

The ED magnet has been redesigned following years of engineering tests and evaluation. The result is a unique design providing more than double the life of the previous Electro Disc brakes ... without any loss in smoothness or controllability.

New pole geometry

The geometry of the magnetic poles has been redesigned to minimize the "leading edge wear" common to all pin mounted friction brakes. Magnet mounting holes do not extend through the face for freer, axial movement.

New armature design

New aluminum armature carriers for 10", 13" and 15" systems provide inertial reduction up to 40%, allowing improved tension control as high speed machines accelerate to core. The radial blower design improves air flow and cooling. Systems run cooler and last longer.

New friction system

The friction system features three important benefits:

- A new, long wearing friction pad material.
- A new, improved balance between the wear rate of the magnetic poles and the friction material.
- A replaceable face friction pad for fast, easy maintenance.

New electronic wear indicator option

An optional, electronic wear indicator is imbedded into the magnets to aid in planning maintenance requirements. An indicator on the Warner Electric control illuminates at the point where 15% of brake life still remains.

MTB Series – Modular Tension Brakes

Emergency Stop Torque Curves

Note: The following curves are for emergency stop torques. For normal running dynamic torque, multiply the emergency stop torque value by .54.

Electro Disc – 10"*

Electro Disc – 13"*

Electro Disc – 15"*

Electro Disc – 20"*

* MTB II Dynamic Torques at 500 mA per magnet, available from TCS series controls during emergency stop.

Modular Design ... tailored to meet your requirements

To select the proper size Electro Disc tension brake, it is important to understand that the brakes are fully modular. This feature enables matching requirements for heat dissipation and emergency stopping torque to the tension brake configuration that optimizes these features.

Selection

The easy-to-use selection charts on page 77 specifies a particular modular combination as listed in the accompanying chart. (See page 78 for selection of basic tension brakes.)

Determining two factors are all that's required.

1. Diameter

Basically heat dissipation capacity is directly proportional to the diameter of the disc.

2. Number of magnets

Torque capacity is proportional to the number of magnets. See page 77 for torque and heat dissipation sizing to meet the specific requirements of your application.

Mounting Configurations

Flexible Mounting

Thrust bearings, side loading, and special supports are a thing of the past!

Universal Mounting Bracket

With addition of a simple "L" shaped bracket (Customer supplied), the universal mount provides a perfectly easy retrofit on older machines.

Bulk Head Mounting Bracket

Use of the bulkhead mount reduces the overall diameter to allow mounting in more constricted or enclosed locations.

Direct (Free) Mounting

For the Machine Builder or retrofitter, the free mount provides the simplest, least expensive option with low profile and diameter advantages. Mounting directly to the side frame of the machine offers all support necessary for performance requirements.

MTB Series – Modular Tension Brakes

Retrofit/Upgrade of MTB to MTB-II

New MTB-II magnets and armature carriers are designed to easily retrofit and upgrade existing MTB applications.

MTB Magnet Weight
3 lb. 4.5 oz. each Magnet

1. **Magnets only** – Existing applications can extend the life of the friction system by installing MTB-II components.

If presently using... MTB MAGNETS

Magnet 5216-631-004

that should go with...

Magnet Carriers

Dual 10" 5216-295-002
13" None
15" & 20" 5216-295-001
Single All 5216-295-003

OR (if Free Mounting)...

Free Mount Pins 5216-101-010
5216-101-008

Upgrade with... MTB-II MAGNETS

Standard Magnet 5216-631-010
or
Magnet with electronic wear indicator 5216-631-009

that should go with...

Dual 10" 5216-295-005
13" 5216-295-006
15" & 20" 5216-295-007
Single All 5216-295-004

OR (if Free Mounting)...

Free Mount Pins 5216-101-029
5216-101-030

- Note:** a) The same number of magnets should be used unless additional considerations exist (consult factory).
b) MTB-II Free Mount Pins (5216-101-029) may replace the pins in the MTB carriers to convert them into MTB-II carriers.

2. **Aluminum Armature Carriers** – Existing applications may be upgraded to aluminum armature carriers with the benefit of reducing armature inertia. This may be done with or without upgrading the magnets.

If presently using... MTB ARMATURE & HUB

10" Armature 5216-111-001

that should go with...

10" Hub 540-0842

15" Armature 5216-111-003

that should go with...

15" Hub 540-1382

Upgrade with... MTB-II ARMATURE & CARRIER

10" Armature 5216-101-025

that should go with...

Tapered Bore Carrier 295-0021
OR
Straight Bore Carrier 295-0026

15" Armature 5216-101-024

that should go with...

Tapered Bore Carrier 295-0019
OR
Straight Bore Carrier 295-0028

- Note:** Due to the orientation of the tapered bore in the integral hub of the MTB-II armature carrier, some existing MTB applications may not readily retrofit to the new assembly (consult factory).

Magnetic Brakes and Clutches

M Series – Permanent Magnet

Fast, precise torque adjustment!

Precision Torq™ clutches and brakes

Precision Torq units provide constant torque independent of slip speed. They offer excellent overload and jam protection for all drive train components and also provide soft starts with zero slip when a preset torque is reached. Precision Torq permanent magnet clutches and brakes do not require maintenance and provide extremely long life.

Features and Benefits

Fast, precise torque adjustment

- Torque is set with a large knurled adjustment ring.
- Infinite adjustability between minimum and maximum settings. This allows units to be fine tuned to your unique requirement.
- Easy to read graduations.

Torque is constant with respect to speed

- By using the Precision Torq unit, you can solve almost any torque control problem.
- Torque is extremely consistent and smooth at low, as well as high speeds.

No external control or power source

- Simple to install
- Nothing to monitor
- Unaffected by power interruption or power fluctuation
- Safe to use

Dependable performance

- Smallest possible transition from static to dynamic torque. Virtually eliminates the “stick-slip” phenomenon associated with friction devices.
- Long life. The only wearing parts are the ball bearings.
- Extremely accurate. Precision Torq units out-perform all other devices at low RPM.

Versatile mounting: Easy to retrofit

- Clutches are available with hollow bores for mounting on motor shafts or jack shafts.
- Bolt circles allow for fixed mounting, adding a pulley, or stub shaft adapters.
- Brakes are available with solid shaft outputs.

Distributor item

- Off the shelf availability.
- Interchangeable with competitors' products.

Specials are our business. . .

- Special shaft bores and keyways
- Shaft extensions
- System retrofits
- Metric bores and keyways
- Stainless steel construction
- Fixed torque units

Magnetic Brakes and Clutches

M Series – Permanent Magnet

Unwind tension control

Brake mounted on shaft of unwind spool or bobbin.

Film unwind
Tension provided by hysteresis units.

Information required:

Full roll diameter (in.) = 6 in.
Core diameter (in.) = 4 in.
Average tension (lbs.) = 4 lbs.
Velocity (feet per min.) = 100 fpm

How to size:

$$\text{Average radius (in.)} = \frac{\text{Full roll dia. (in.)} + \text{Core dia. (in.)}}{4}$$

$$= \frac{6 + 4}{4} = 2.5 \text{ in.}$$

$$\text{Torque (lb.in.)} = \text{Avg. tension (lbs.)} \times \text{Avg. radius (in.)}$$

$$= 4 \times 2.5 = 10 \text{ lb.in.}$$

Check tension range:

$$\text{Max. tension} = \text{Torque (lb.in.)} \times \frac{2}{\text{Core dia. (in.)}} = 10 \times \frac{2}{4} = 5 \text{ lbs.}$$

$$\text{Min. tension} = \text{Torque (lb.in.)} \times \frac{2}{\text{Full roll dia. (in.)}} = 10 \times \frac{2}{6} = 3.3 \text{ lbs.}$$

$$\text{Slip watts} = \frac{\text{Max. tension (lbs.)} \times \text{velocity (fpm)}}{44.2}$$

$$= \frac{5 \times 100}{44.2} = 11.3 \text{ watts}$$

Select Model MC4

Cycling

Bottle capping

Constant torque provided by a hysteresis clutch.

Information required:

Slip RPM = 500 RPM
Torque = 8 lb.in.
% slip time of total cycle time = 25%

How to size:

$$\text{*Watts} = .0118 \times \text{torque (lb.in.)} \times \text{slip RPM} \times \% \text{ slip time}$$

$$= .0118 \times 8 \times 500 \times .25 = 11.8 \text{ watts}$$

Select an MC4 from the specification chart.

*Note: Consult factory if peak slip watts are extremely high or if duration of slip period is in excess of 1 minute.

Nip roll or pulley tension control

Coil winding
Constant tension provided by hysteresis unit.

Film tensioning
Constant tensioning supplied by hysteresis unit.

Information required:

Pulley or nip roll diameter = 4 in. Tension = 6 lbs. Velocity = 100 fpm

How to size:

$$\text{Torque (lb.in.)} = \text{Tension (lbs.)} \times \frac{\text{Dia. (in.)}}{2} = 6 \times \frac{4}{2} = 12 \text{ lb.in.}$$

$$\text{Slip watts} = \frac{\text{Tension (lbs.)} \times \text{velocity (fpm)}}{44.2} = \frac{6 \times 100}{44.2} = 13.5 \text{ watts}$$

Select Model MC5

Overload protection/Torque limiting/Soft start

Motor horsepower method

Torque limiting
Hysteresis clutch provides overload protection.

Material handling
Hysteresis clutch can provide overload protection and soft start.

Information required:

Motor HP = 1/2 HP
Motor RPM = 1750 RPM

How to size:

$$\text{Torque (lb.in.)} = \frac{\text{HP} \times 63000}{\text{RPM}}$$

$$= \frac{1/2 \times 63000}{1750} = 18 \text{ lb.in.}$$

Select an MC5 from the specification chart.

Stainless steel clutches and brakes for harsh environments

Caustic washdown solutions can cause corrosion and eventual failure in food processing applications such as meat and poultry. That's why we have introduced a new line of all stainless steel clutches and brakes. These units, featuring 400 series stainless steel bearings, are robust enough to handle the most hostile washdown environments and tough enough to perform 24/7.

Heat Dissipation & Torque Setting Charts

Heat Dissipation Charts

Torque Setting Charts

*Torque values are approximate.

Stub Shaft Adapters

- Utilized when “clutch coupling” configuration is desired.
- Comes complete with attachment hardware and drive key.
- Stub shaft adapters should be used in conjunction with a flexible coupling.
- Also available in Stainless Steel.

*If Solid Shaft Series is used with adapter, thumb screw must be removed and replaced with set screws.

Magnetic Particle Brakes and Clutches

Accurate torque control with instantaneous engagement!

Available in a wide range of models and sizes

Warner Electric's magnetic particle brakes and clutches are quiet and clean and provide outstanding performance in slipping and torque control applications. They are ideal for unwind, rewind, and intermittent (point to point) tension applications. They are also ideal for controlled starting or stopping, torque limiting and cycling applications.

These units use high quality materials and unique designs to provide precision performance, superior heat dissipation and extremely long life. The magnetic powder, made from alloy, provides extreme resistance to heat and wear, and, therefore, promotes long life and high thermal ratings. Also, one of the brake models, the PTB, incorporates a heat pipe that further extends its thermal capability. PTB units have thermal ratings three times higher than brakes with natural cooling and equivalent to water-cooled brakes.

Brakes

Six different brake models are available: four with male shafts and two

with hollow bores. The units with hollow bores can be shaft-mounted, if desired. Final selection is determined by torque and thermal requirements. The product selection section provides more specific information on these models.

Clutches

Three different clutch models, each with several sizes, are available to

handle a variety of applications. The face-mounted models can be used in parallel or inline applications. The shaft-mounted units offer a second option for parallel shaft applications and are ideal for tension rewind applications. Please see the product selection section for more specific information.

Magnet Particle Brakes and Clutches

Features and Benefits

Precise Control

- Spherical particles provide smooth torque independent of speed. Low speed chatter is also eliminated.
- The magnetic circuit is designed to produce torque proportional to current.
- Unique design requires only one powder seal, thus reducing drag torque and allowing for a wider operating range.

Extremely Long Life

- Spherical particles made from alloy provide outstanding resistance to corrosion and mechanical breakdown.

High Heat Dissipation

- One of the models, the PTB, uses a heat pipe that provides heat dissipation levels equal to water-cooled units and several times greater than natural cooling.
- The shaft mounted clutches provide self-cooling through the use of an integral fan that rotates with the input.

Clean Operation

- All models are completely enclosed. Ideal for applications where clean operation is desired.

Easy to Mount

- Precision pilots are provided to position units for easy installation.
- Clutches and brakes with hollow bores are offered for applications where shaft mounting is desired.

Smooth Engagement

- Torque characteristics provide for smooth and controllable acceleration or deceleration of the load.

Fast Response

- Fine particles respond quickly to field for millisecond engagement, if required.

No Maintenance

- Adjustment or lubrication is not required.

Quiet Operation

- Engagement is smooth and quiet.

Low Current Draw

- Efficient magnetic circuit design allows for minimal current draw.

Torque independent of slip speed

Torque is transmitted through magnetic particle chains that are formed by an electromagnetic field. The torque is independent of slip speed, depending only on circuit current, and is infinitely variable from 0 (disengaged) to rated torque.

No wearing parts

There are no friction surfaces to grab or wear, and the units are not affected by changes in atmospheric or other environmental conditions.

Efficient/Compact design

High torque to size ratio and low electric power consumption.

Versatile mounting

Convenient bolt circle for easy mounting. Mounting brackets available for all sizes. Brakes are available with solid shafts and through bores. Can only be mounted horizontally.

Distributor Item

Interchangeable with industry standard sizes.

Special Designs

▪ **Special Shaft Configurations**

Customer specified shaft configurations for easy machine mounting and retrofitting.

▪ **Special Torque**

Maximum torque configurations to meet customer specifications.

▪ **Special Mounting Configurations**

Customer specified bolt patterns, special mounting brackets.

▪ **Metric units**

Magnetic Particle Brakes and Clutches

Design and Operation

Warner Electric magnetic particle clutches and brakes are unique because of the wide operating torque range available. Torque to current is almost linear and can be controlled very accurately. The unique features of the magnetic particle clutches and brakes make them ideal for tension control, load simulation, cycling/indexing, and soft starts and stops. Controls information starts on page 38.

MPB Products

PTB Brake

Magnet Particle Brakes and Clutches

POC Clutch

Principle of Operation

The magnetic particle unit consists of four main components: 1) housing; 2) shaft/disc; 3) coil and 4) magnetic powder. The coil is assembled inside the housing. The shaft/disc fits inside the housing/coil assembly with an air gap between the two; the air gap is filled with fine magnetic powder.

Engagement

When DC current is applied to the magnetic particle unit, a magnetic flux (chain) is formed, linking the shaft/disc to the housing. As the current is increased, the magnetic flux becomes stronger, increasing the torque. The magnetic flux creates extremely smooth torque and virtually no "stick-slip".

Disengagement

When DC current is removed, the magnetic powder is free to move within the cavity, allowing the input shaft to rotate freely.

Cycling

A cycling effect is achieved by turning the current to the coil on and off.

Magnetic Particle Brakes and Clutches

Selection

Unit torque ratings go from as low as 2.0 lb.in. to as high as 578 lb.ft. Also, many models are available to handle specific mounting requirements. The clutch family has three options. The MPC and POC have shaft inputs and outputs and is ideal for inline applications. The PHC models have a hollow bore and can be shaft-mounted for parallel shaft applications. The PMC clutch covers the lower end of the torque range and has a flanged input hub. Also, this unit is often mounted as a brake.

The brake family includes seven models. The MPB covers the low torque ranges and comes with shaft inputs or hollow bores. The POB is a shaft input brake that covers the medium and high torque extremes of the torque range. The PRB series covers the mid range. With four models that have different input and housing options. The PTB model uses a heat pipe cooling method that has a cooling capacity equivalent to water-cooled units, but without the hassles of water cooling.

Selection Requirements

To properly size a magnetic particle brake or clutch, torque transmitted and heat generated must be considered. If you know these values, refer to the specifications and thermal curves to select a unit. For sizing and selection calculation see pages 16 through 28. To select a control for your application refer to the control section on page 38.

| Product | Model | Torque Ratings (lb.ft.) | Heat Dissipation Ratings Watts [HP _r] |
|-----------------|--|---------------------------------|---|
| Brake | MPB  | 0.17 lb.ft.–20 lb.ft. | 10–200 [0.013 to 0.27] |
| | POB  | 2.1 to 578 | 60 to 4,000 [0.080 to 5.36] |
| | PRB-H  | 8.6 to 144 | 95 to 575 [0.13 to 0.77] |
| | PTB-BL ₃  | 18 to 144 | 500 to 4,100 [0.67 to 5.50] |
| Brake or Clutch | PMC-A ₃  | 0.72 to 2.8 (8.6 to 34 lb. in.) | 30 to 66 [0.040 to 0.088] |
| Clutch | MPC  | 0.17 lb.ft. to 10.0 lb.ft. | 10 to 140 [0.13 to 0.188] |
| | PHC-R  | 4.3 to 144 | 70 to 1,150 [0.094 to 1.54] |
| | POC  | 2.1 to 578 | 60 to 4,000 [0.080 to 5.36] |

Magnet Particle Brakes and Clutches

| Description | Cooling Method | Applications | Dimension Drawings (page no.) |
|--|--------------------------------|--|-------------------------------|
| Low and high torque units. Light duty thermal. All brakes have output shafts and pilots for mounting. Optional brackets available. | Natural | Tension unwind, light duty unwind | 104 |
| Low and high torque units are offered in this model. All units have male input shafts and pilots for mounting, except for the size 80, which is foot-mounted. | Natural | Tension unwind | 106-107 |
| This is the basic PRB model. It is offered with a hollow bore and a pilot for mounting. | Natural | Tension unwind | 108 |
| The PTB-BL ₃ offers superior heat dissipation capability. Units are pilot-mounted and a male input shaft is provided for connecting to the load. | Heat Pipe with 115VAC blower | Tension unwind, load for testing. Ideal for applications requiring high heat dissipation | 105 |
| These units offer precise control in the small tension ranges. They have flanged input hubs and double-ended output shafts for maximum mounting flexibility. They can be easily mounted as clutches or brakes. | Natural | Tension unwind or rewind, soft start or stop, torque limiting | 109-110 |
| Low and medium torque units for light duty rewind applications. Shaft in-shaft out with pilots, allow for sample mounting. Optional brackets available. | Natural | Tension rewind, light duty rewind | 111 |
| This model has a hollow bore, making it ideal for applications where shaft mounting is preferred. It has a piloted input flange for pulley or sprocket attachment. | Self-cooling with integral fan | Tension rewind, soft start | 112 |
| This model is preferred in many applications. It is offered with male input and output shafts and all units are pilot mounted, except for the size 80. This largest unit, the size 80, is footmounted. | Natural | Tension rewind | 113-114 |

Magnet Particle Brakes and Clutches

Sizing

To properly size magnetic particle clutches or brakes the thermal energy (slip watts) and torque transmitted must be considered. If thermal energy and torque are known for the application select the unit from the charts to the right.

RPM

RPM must be known when calculating thermal energy (slip watts). For load simulation, torque limiting and similar applications, RPM is known. For web handling, the RPM is calculated as follows:

$$\text{Slip RPM}^* = \frac{12 \times \text{Velocity (feet per min.)}}{\pi \times \text{Full Roll Dia.}^{**} \text{ (in.)}}$$

*In rewind applications the motor RPM should be higher (10%) than the fastest spool RPM.

**In applications with the web running over a pulley or in a nip roll application use the pulley diameter as the roll diameter.

Thermal Energy (slip watts)

Tension applications are considered continuous slip applications. When a brake or clutch is slipping, heat is generated. Heat is described in terms of "energy rate" and is a function of speed, inertia, and cycle rate. Heat generated is usually described in terms of thermal energy or slip watts. Starting and stopping applications generate heat when the unit slips during the stopping and starting of the load.

- For continuous slip applications, such as tension control in an unwind or rewind application slip watts are calculated using the following formula:

$$\text{Slip Watts} = .0118 \times \text{Torque (lb.in.)} \times \text{Slip RPM}$$

- For cycling applications heat is generated intermittently, and is calculated using the following formula:

$$\text{Watts} = 2.67 \times \text{Inertia (lb.in.}^2\text{)} \times \left(\frac{\text{RPM}}{10,000}\right)^2 \times F \frac{\text{cycle}}{\text{min.}}$$

Duty Cycle

The average heat input must be below the clutch or brake's heat dissipation rating. If the application generates intermittent heat dissipation, use the average speed for the thermal energy (slip watts) calculations.

Quick Selection Charts

Torque

Tension applications calculate torque as a function of roll radius and tension. Soft/controlled stopping applications calculate torque as a function of inertia, speed and desired time to stop the load. Torque limiting applications calculate torque as the allowable drive through torque. Calculate the torque requirement based on the formulas for the different applications:

- To calculate torque for a web handling application, determine the desired tension in the web then calculate the required torque as follows:

$$\text{Torque (lb.in.)} = \frac{\text{Tension (lbs.)} \times \text{Roll Dia.}^* \text{ (in.)}}{2}$$

*Use full roll diameter. In applications with the web running over a pulley or in a nip roll application use the pulley diameter as the roll diameter.

- To calculate torque for soft/controlled stop or cycling applications first determine the inertia (WR^2), and apply it to the formula below:

$$\text{Torque (lb.in.)} = \frac{\text{Inertia (lb.in.}^2\text{)} \times \text{RPM}}{3,690 \times \text{time(s)}}$$

$$\text{Inertia (WR}^2\text{)} = [(\text{weight of body}) \times (\text{radius of gyration}^*)]^2$$

*to calculate for a cylinder about its axis:

$$\text{Solid cylinder} = R^2 = 1/2r^2$$

$$\text{Hollow cylinder} = R^2 = 1/2(r_1^2 + r_2^2)$$

Magnetic Particle Brakes and Clutches

Heat Dissipation Curves

Operating Temperature

The surface temperature of the unit must be less than the temperature indicated in the following chart.

Maximum Surface Temperature

PRB-H Series Brakes

This is the basic PRB model. It is offered with a hollow bore and a pilot for mounting.

Note: All dimensions are nominal unless otherwise noted.

These units offer precise control in the small tension ranges. They have flanged input hubs and double-ended output shafts for maximum mounting flexibility. They can be easily mounted as clutches or brakes.

PHC-R Series Clutches

This model has a hollow bore, making it ideal for applications where shaft mounting is preferred. It has a piloted input flange for pulley or sprocket attachment.

Note: This is a stationary field clutch. The tapped holes "L" in the field are for securing the housing to prevent it from rotating. This can be done with capscrews or with a restraining strap. Do not block ventilation openings when mounting.

Note: All dimensions are nominal unless otherwise noted.

This model is preferred in many applications. It is offered with male input and output shafts and all units are pilot mounted, except for the size 80. This largest unit, the size 80, is foot mounted.

Magnetic Particle Brakes and Clutches

Overhung Load

When an overhung load (side load) is applied to the shaft, verify that this load does not exceed the maximum allowable. Operating speed and where the load is applied to the shaft (see Dimension A, below) must be known. For speed, determine the speed coefficient from the coefficient table. Also, determine the allowable overhung load from the chart based on Dimension A. Multiply the load from the chart times the speed coefficient to determine the allowable load for the application.

Overhung Load

Note: Shaft extensions are not recommended.

Pulley or Sprocket Load

For most applications, the overhung load is caused by pulleys or sprockets. The smaller the pitch diameter (PD) of the pulley or sprocket, the higher the belt or chain tension, and, therefore, the greater the overhung load. To determine the minimum pulley diameter for the application, use the following equation:

$$\text{Minimum PD (in.)} = \frac{24 TK}{CR}$$

T = Torque (lb.ft.) This is the torque actually being transmitted, not necessarily the maximum torque capacity of the brake.

K = Safety factor for the tension in type of drive. Use 1.2 to 1.5 for sprockets, 2 to 4 for belts.

C = Speed coefficient from table.

R = Radial load allowable at 1,000 RPM.
(The allowable radial loads for various locations on the shaft are given in the Allowable Load chart.)

Example: Determine the minimum sprocket diameter that can be used on a PRS-5S. Dimension A is 1.1 inches, the torque requirement is 20 lb.ft. and the speed is 600 RPM.

$$\begin{aligned} \text{Minimum PD (in.)} &= \frac{24 \times 20 \times 1.5}{1.2 \times 214} \\ &= 2.8 \text{ inch minimum PD} \end{aligned}$$

Pneumatic Brakes

Mistral Brakes

Modular design permits variable tensioning capacities!

Wichita Clutch's Mistral pneumatic tension brakes are ideally suited to the needs of the corrugating market for which it was originally designed. It is also a versatile product which is finding favor in additional tensioning applications. Wichita Clutch designers and engineers consulted extensively with mill roll stand manufacturers and users to offer a tension brake ideally suited to the needs of this particular market. The result is a compact, high performance, versatile brake capable of handling the tensioning needs of the latest machine designs, as well as existing equipment. The Mistral paves the way for increasing line speeds by 5.4 feet/sec. from 810 feet/min. (or slower) to 1,140 feet/min.

Varying number of actuators provide optimum tension control

Each brake may be specified with a varying number of pneumatic actuators, allowing precise selection of brake torque capacity for optimum tension control.

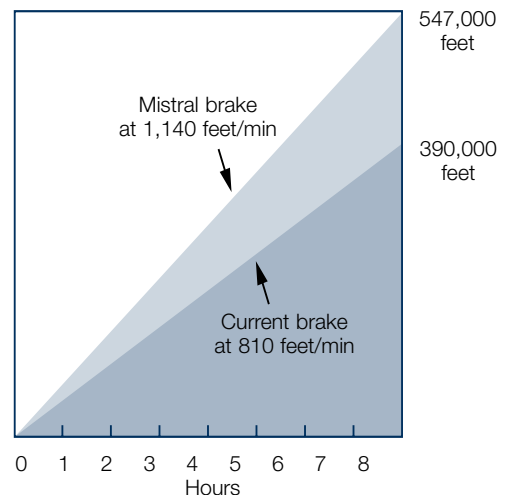

Compact Design

Mistral brakes are compact at only 11.6" or 16.1" in diameter. Their size facilitates the pickup of small, part reels used in short batch runs. For automatic reel loading machines, Mistral offers optional infrared and speed sensor installation within the brake. And their modern, industrial styling enhances the appearance of any machine on which they are used.

Easy Access with Removable Cover Panel

By removing just three cap screws, the Mistral's front cover can be detached for easy and fast access to internal parts. Cover removal automatically disconnects both air and electricity.

Performance Curve

Pneumatic Brakes

Mistral Brakes

Mounting Ease

Three bolts mount the brake to the arm of the mill roll stand or machine frame and an optional pilot location makes fitting to both new and existing machines a simple operation.

Wear Indicator

A brake wear indicator, which is conveniently located for easy visual inspection, means no down time to check remaining friction material life.

Easy Connection

Air and electrical connections are easily accessible for fast, simple installation and maintenance.

Safety

Mistral's integral guarding eliminates the cost and effort of installing external guards. Operator safety is further enhanced by automatic air and electric disconnects when the front cover is removed.

Integral Cooling

A rugged, high performance, low energy usage fan is housed within the brake for high heat dissipation — a must for increased productivity through controlled tension at many roll speeds.

Brake Discs and Cooling

The ModEvo brake disc was developed at the Bedford, UK factory using Finite Element Analysis techniques to ensure maximum strength with minimum weight. The design is optimized to make best use of the cooling air available at slow speeds, and being bidirectional, it achieves high heat dissipation capacity in either rotational direction, unlike some other brakes. An optional electric cooling fan is available where space is limited or more extreme heat handling is required.

Available in five sizes: 250 mm, 300 mm, 350 mm, 400 mm and 450 mm diameters, all discs are the same thickness and use the same brake modules and actuators. Each disc can be specified with a minimum of a single module, up to the maximum number of modules that can be fitted around the disc. This allows torque-

handling capabilities ranging from a maximum of 659 lb.ft. for the 250 mm disc, up to 3181 lb.ft. for the 450 mm disc.

NOTE: If using a high speed ductile iron disc the catalog heat rating should be reduced by 10% as the thermal conductivity of the ductile iron is less than grey cast iron.

| Maximum Rotational Speed | | |
|--------------------------|--------------------------|----------------------|
| Disc Diameter mm | Standard Speed rev./min. | High Speed rev./min. |
| 250 | 2,250 | 3,375 |
| 300 | 1,900 | 2,850 |
| 350 | 1,650 | 2,475 |
| 400 | 1,450 | 2,175 |
| 450 | 1,250 | 1,875 |

Actuator Options

Newly developed rolling diaphragm actuators are used in ModEvo, producing more force than previous designs to allow higher torque ratings. However, the sensitivity for which rolling diaphragms are favored is not compromised. Three actuator options are available, offering clamping forces of 100%, 60% or 25%.

The finned, die cast aluminum brake module is common to all brake disc diameters. Each module houses two pairs of actuators, and allows friction pads to be changed quickly without dismantling the module.

| (200 mm) | not available | Yes | Yes |
| (250 mm) | not available | Yes | Yes |

Optional Guard

The optional guard has a plastic front with 'ModEvo' molded in and a metal ventilated perimeter.

Mounting is by four brackets on customer's machine frame.

The center of the guard is designed such that it may be cut-out by customer to suit the diameter of the shaft in through-shaft installations.

** For intermittent duty, consult the factory.

¹ Max. speed is with standard brake disc. A high speed brake disc capable of 50% higher speed is also available. Heat Capacity reduced by 10% when high speed disc is used.

² When selecting number of actuators, use a limit of 3.35 HP per actuator pair (2.5 kW per Actuator pair) for duty w/o fan and 3.75 HP per Actuator pair (2.8 kW per Actuator pair) when fan cooled.

Note: Limit maximum operating temperatures of surfaces (rotor, friction pads, actuators, etc.) to 300°F or less. Temperatures above 300°F may cause damage and failure of components. Failure to do so will void warranty.

** For intermittent duty and thermal ratings using 200 mm fan, consult the factory.

¹ Max. speed is with standard brake disc. A high speed brake disc capable of 50% higher speed is also available. Heat Capacity reduced by 10% when high speed disc is used.

² When selecting number of actuators, use a limit of 3.35 HP per actuator pair (2.5 kW per Actuator pair) for duty w/o fan and 3.75 HP per Actuator pair (2.8 kW per Actuator pair) when fan cooled.

Note: Limit maximum operating temperatures of surfaces (rotor, friction pads, actuators, etc.) to 300°F or less. Temperatures above 300°F may cause damage and failure of components. Failure to do so will void warranty.

Sensors

Ultrasonic Sensors

Introduction

Ultrasonic signals are like audible sound waves, except the frequencies are much higher.

Ultrasonic transducers have piezoelectric crystals which resonate to a desired frequency and convert electric energy into acoustic energy and vice versa.

Diagram A shows how sound waves transmitted in the shape of a cone are reflected back to the transducer. At this stage, an output signal is produced to perform some kind of indicating or control function.

A minimum distance from the sensor is required to provide a time delay so that the “echoes” can be interpreted. Variables which can affect the operation of an ultrasonic sensor include: target surface angle, reflective surface roughness, change in temperature or humidity. The targets can have any kind of reflective form and even round objects are an acceptable target.

Advantages of Ultrasonic Sensors

- Discrete distances to moving objects can be detected and measured
- Less affected by target materials and surfaces
- Not affected by color
- Solid state – virtually unlimited maintenance-free life
- Small objects can be detected over longer distances
- Resistance to external disturbances such as vibration, infrared radiation, ambient noise, and EMI radiation

Applications for Ultrasonic Sensors

- Loop control
- Roll diameter, tension control, winding and unwind
- Web break detection
- Level detection/control
- Presence detection

UT30 Series

The Warner Electric UT30 Series Ultrasonic Sensors feature three types of sensors:

- Range measurement with analog output
- Proximity detection with range and hysteresis control
- Long range measurement with analog output
- CE Approved

Range Measurement with Analog Output

This type of sensor is capable of both 4–20mA and/or 0–10V output signals, with an added feature of inverting these signals to 20–4mA and for 10–0V by means of simply wiring the units in the instructed way. Long range sensors come with current (mA) output signals only.

A range measurement sensor works in a very precise, easily controllable way. Precise distance of an object moving to and from the transducer is measured via time intervals between transmitted and reflected bursts of ultrasonic sound. The internal circuit reads this time and then proportionately provides an output in either MAs or volts to that distance.

General Installation Information

Target Angle

This term refers to the “tilt response” limitations of a given sensor. Since ultrasonic sound waves reflect off the target/object, target angles indicate acceptable amounts of tilt for a given sensor. If an application requires a target angle beyond the capabilities of a single sensor, two sensors can be teamed to provide even a broader angle of tilt.

Beam Spread

This term is defined as the area in which a round wand will be sensed if passed through the target area. This is the maximum spreading of the ultrasonic sound as it leaves the transducer.

Analog Output

- 4–20mA and 0–10V
- Wire selectable inverted or non-inverted outputs

Voltage Output Inverted

***Note:** Some controls do not have 24 VDC outputs for the ultrasonic sensor power. These controls require the use of the NG 24 power supply

Sensors

Ultrasonic Sensors

Operation and Setup

Minimum Analog Ranging

Minimum analog ranging is when you desire to have the full 4–20 mA or 0–10V output over the minimum 5-inch sensing span. Five inches of minimum sensing span can be adjusted anywhere in the sensing range. For example 10"–15" or 25"–30". To make this adjustment, place the target at the minimum sensing range and adjust P1 to 4mA. Then move the target to the maximum sensing range and adjust P2 to 20mA. Recheck the ratings and make appropriate adjustments, if necessary. See Diagram A.

Maximum Analog Ranging

Analog sensing in the maximum range means utilizing the entire 36" span (4"–40") and 72" span (8"–80"). To adjust, set the target at the minimum range, either 4" or 8", and adjust P1 to 4mA. Move the target to the maximum range and adjust P2 to 20mA. Recheck readings and make appropriate adjustments, if necessary. See Diagram B.

Inverted Analog Outputs

Inverted outputs means that the 4–20mA or 0–10V output signal will decrease proportionally with distance. To adjust, place the target at the minimum sensing distance and adjust P1 to 20mA. Place the target at the maximum sensing distance and adjust P2 to 4mA. Re-check readings and make appropriate adjustments, if necessary. See Diagram C.

LED Operation

The LED is green when the unit is powered. It will fade to red as a target is detected with increased intensity as more signal is being reflected from the target.

Note: Any color other than green equals a workable signal level.

Dodge is a registered trademark of Reliance Electric Company

Analog (as in analog signal)

A signal that varies in amplitude or voltage over a given range.

Analog Follower Control

A control that accepts a voltage or current of varying amplitude and produces an identical, but stronger, signal at the output, suitable for driving a brake.

Butt Splice

A splice in which two webs are placed end to end without overlapping, and adhered together by a piece of adhesive placed over both. Most common with paperboard.

Controlled Stop

Stopping of the roll and web while maintaining tension at the prescribed level.

Core

The hollow center (usually made of heavy paperboard) on which the roll of material is wound.

Core Diameter

The smallest diameter of an unwind roll.

Cutter/Creaser

A machine used in the production of folding cartons. It uses sharp knives to cut through the board and dull knives to crease the board along a fold line.

Dancer

A movable, often pivoted, roll placed in a loop of the web, which is weighted or loaded to add tautness or tension to the web. Often used as part of a feedback loop to control brake operation.

Die Cutter

A machine which cuts or stamps paper or board to a specified size or shape with a steel die. The die is part of an impression cylinder in a rotary die cutter.

Duplex

Paper or paperboard that has a different color, texture or finish on either side. Also sometimes applied to any multi-ply paperboard.

Electro-Pneumatic Modulator

A device that modulates, or controls, an air brake in response to a set of control parameters.

Emergency Stop (E-Stop)

General term to describe immediate stop of a converting or printing machine due to a malfunction or unsafe condition. Normally done in fastest time possible.

Equipment Sizing or Sized

A method of tensioning a web at the in-feed that is sometimes used in printing operations. An equipment sized in-feed roller is slightly smaller than the printing impression cylinder. This creates a back tension in the web since each rotation of the printing impression cylinder pulls more web than is being fed by each rotation of the in-feed roller. Not as common as a variable sized in-feed since it requires changing the in-feed roller along with the impression cylinder.

Festoon

A reserve area consisting of several loops of stored web. This reserve is drawn down to feed the converting process while roll feed is interrupted for splicing.

Force Transducer

A device that senses the magnitude of a load upon it (such as a tension load) and sends a corresponding signal out. Also called a load cell.

Grabiness

“Stick-slip,” or lack of smoothness during slip operation of a braking system.

Heat Dissipation (in a brake)

The ability of a brake to release heat generated by friction. Dissipation usually increases with RPM. Dissipation can also be increased by forced cooling, e.g., by a fan.

Inertia Stop

An emergency stop where the prime objective is to get the unwind roll and machine to a rapid stop, disregarding any control of the web condition. The inertia of the roll is the largest factor in determining speed of stop, for a given machine braking system.

Lap Splice

A splice in which the ends of two webs are overlapped and adhered together by a piece of adhesive placed on the contact side of one.

Load Cell

See Force Transducer.

Nip Rolls

A pair of driven, rotating rollers which act to pull the web into or through the converting process.

Pivot Point

The central point of rotation, as in a dancer arm.

Pivot Point Sensor

A sensor mounted at the pivot point of the dancer arm, which determines which direction the dancer is moving, and where it is in its arc of travel.

Register

The exact, corresponding placement of successively printed images on the web of material.

Sheeter

A machine that cuts a web of material into individual sheets.

Slip

The relative motion, or sliding, between the two members of a braking system. In tensioning, the smoothness of slip is critical to maintaining tension.

Slitter-Rewinder

A machine that unwinds the wide rolls of material, slits them to narrow widths, and rewinds them into narrow rolls.

Splice

The joining of the ends of two webs to make one continuous web.

Splicer

A machine with two (or more) unwind rolls of material. As one roll expires, the other is “spliced” to the end of the first, to provide a continuous web of material to the process. Splicers are referred to as “zero-speed” if the splice occurs when the new roll is stopped, with paper feeding from a festoon storage system. A “flying splicer” is one where the new roll is accelerated to line speed before splicing the roll, and roll feed is continuous.

Taper Tension

Constantly decreasing tension on winders to help eliminate telescoping and core crushing.

Tensile Strength

The force, parallel to the plane of the specimen, required to break a given length and width of material.

Tension

The tautness in a web of paper or material. The press or process produces a “pull-through” effect, which is countered by the unwind brake. Each material has an optimum tautness, or tension, and it is the job of the tension system to maintain this tension.

Torque

The braking force which holds the unwind roll from unwinding. Usually referred to in pound-feet or pound-inches of torque produced by the brake.

Transducer

A device that changes one type of signal into another. In tensioning, the most common types are electric-to-pneumatic transducers, and force transducers. See Force Transducer.

Web

A continuous strand of material coming from the roll in its full width. It remains in web form until “terminated” by a sheeter, die-cutter or other device.

Web Break Detectors

Sensing devices that monitor the web and signal a shutdown or E-stop if a web break occurs. This is a good photoelectric application.

Web Draw

Tension or tautness induced in the web by the pulling action of the printing press or process, resulting in web movement in that direction.

Wrap Angle

Refers to the wrap of the web around a roller, especially a dancer roller. Expressed as “degrees of contact” with the roller.

Conversion Factors

Millimeters x 0.03937 = inches

Inches x 25.4 = millimeters

Centimeters x 0.3937 = inches

Inches x 2.54 = centimeters

Meters/minute x 3.280 = feet/minute

Feet/minute x 0.3048 = meters/minute

Kilograms x 2.205 = pounds

Pounds x 0.4536 = kilograms

Newtons x 0.22482 = pounds

Pounds x 4.448 = Newtons

Watts x 0.001341 = horsepower

Horsepower x 746 = watts

Kilogram-meter² x 23.753 = pound-feet²

Pound-feet² x 0.0421 = kilogram-meter²

Newton-meter x 0.722 = pound-feet

Pound-feet x 1.385 = Newton-meter

Grams/meter² x 0.613495 = pounds (basis weight)

Pounds (basis weight) x 1.630 = grams/meter²

$$\text{Lineal feet} = \frac{36,000 \times \text{roll weight}}{\text{roll width} \times \text{basis weight}}$$

$$\text{Approximate roll unwind time} = \frac{\text{lineal feet}}{\text{linear speed}}$$

Effective cylinder force at a given air pressure

$$F_{\text{CYL (lbs.)}} = P_{\text{PSI}} \times \frac{(\text{cylinder piston diameter}) \text{ in (in)}^2 \times \pi}{4}$$

Example: PSI = 30

CYL dia. = 2 in.

$$F = 30 \times \left(\frac{2^2 \times \pi}{4} \right) = 94.2 \text{ lbs.}$$

Warner Electric Clutch/Brake Products

Warner Electric engineers, manufactures and markets, a wide array of electromechanical components and systems for controlling motion. Designed to help increase productivity, our products are incorporated into new equipment designs and are also used to upgrade performance on machines already in service. With an international organization of stocking distributors and sales centers, Warner Electric offers the most extensive network of its kind for locally available products and professional, on-the-spot customer service.
